Introduction

The *Computer Interfacing Manual* provides a complete summary of all commands supported by the Arroyo Instruments line of products. While in remote control mode, the computer interface allows full operation of the instrument, plus advanced features only available via the computer interface.

You will find in reviewing the command set that it is largely compatible with both ILX and Newport laser diode drivers and temperature controllers. In fact, for many applications, you can use an Arroyo Instruments controller in place of a Newport or ILX instrument with little to no change in the commands used to control the instrument.

The RS232 Interface

Some instruments provide a RS232 serial interface, a common, easy-to-use interface for controlling the instrument. With baud rates up to 115k baud, high-speed control and measurement is possible.

Cable Connections

The RS232 interface is a male DB9 pinned identically to a standard PC RS232 port, so a female/female cable in NULL modem configuration (transmit and receive pins swapped) is required. The full pin-out is described below:

<table>
<thead>
<tr>
<th>Pin</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Receive</td>
</tr>
<tr>
<td>3</td>
<td>Transmit</td>
</tr>
<tr>
<td>5</td>
<td>Ground</td>
</tr>
<tr>
<td>Shell</td>
<td>Earth ground</td>
</tr>
</tbody>
</table>

**RS232 Connector (DB-9 Male)**

Depending on if you are connecting to a DB9 or DB25 on the PC, follow the pin-to-pin assignments in the table below:

<table>
<thead>
<tr>
<th>Instrument</th>
<th>PC DB9</th>
<th>PC DB25</th>
</tr>
</thead>
<tbody>
<tr>

<td>2</td>
<td>3</td>
</tr>
<tr>
<td>5</td>
<td>5</td>
<td>7</td>
</tr>
</tbody>
</table>

**Instrument to PC pin assignment**

Interface Settings

- **Baud Rate**: The instrument will operate at 300, 1200, 2400, 4800, 9600, 19200, 38400, 57600, and 115200 baud rates. The baud rate can be set through the instrument’s menu, with a factory default of 9600, and must match the setting on the PC
- **Parity**: None
- **Data Bits**: 8
- **Stop Bits**: 1
- **Flow Control**: None

Ensure to disable flow control. Failure to do so will prevent the instrument from sending data back to the PC.
The USB Interface

Because of its speed, expandability, and commonality, the USB interface has become the interface of choice for newer PC-connected devices. Unlike GPIB, USB uses inexpensive cables and allows up to 127 devices to be connected to a single USB master.

Using the Arroyo Instruments USB Interface

To keep complexity to a minimum, once you have installed the USB drivers, the instrument will appear as a virtual serial port that you can use just like a normal serial port. In this way, you can communicate to the instrument without requiring special software modifications to your existing applications.

Loading the Software Drivers

Unlike the RS232 interface, using the USB interface requires software drivers (provided on the CD with your instrument or available over the Microsoft Windows Update service) to be loaded onto your PC. Follow the instructions in your instrument manual for installing the USB drivers.

Once a COM port has been assigned to an instrument, it will continue to use the same COM port unless it is reassigned through the Control Panel.

Cable Connections and Interface Settings

The Arroyo controller uses a full-size USB Type B socket. You may use any USB 1.1 or 2.0 certified cable. The baud rate is fixed at 38,400.

Baud Rate 38400
Parity None
Data Bits 8
Stop Bits 1
Flow Control None

Ensure to disable flow control. Failure to do so will prevent the instrument from sending data back to the PC.

The Network Interface

Some instruments, such as the 7000 Series MultiSource Controllers, are equipped with a Ethernet network interface. For larger installation, the network connectivity can be advantageous over traditional USB or RS232-connected instruments.

Using the Arroyo Instruments Network Interface

The network interface on the MultiSource can be used in one of two ways: a Telnet connection to port 10001 or using the COM Port Redirector software to create a virtual COM port (VCP).

The Telnet connection requires no additional software, but the program making the connection must be able to communicate over network connections.
Loading the COM Port Redirector Software

A simpler approach is to use the COM Port Redirector (CPR) software, which will create a virtual COM port much like the USB connection. No specialized networking support is required, and the same program that can communicate over the USB VCP can also be used with the network VCP.

To install the CPR software, either download from the Arroyo Instruments web site, or you can find it on the CD you received with the MultiSource. Follow the on-screen prompts to install the software.

Once installed, start the software. You will also find instructions along with the installation program on how to identify and install the virtual COM port. Follow those instructions to add a new COM port and connect it to the IP address of the MultiSource.

In most cases the CPR software will detect the MultiSource when you click Search for Devices, but if you need to manually determine the IP Address information, you can do so by reviewing the IP settings in the Network menu of the MultiSource. If you have multiple MultiSource controllers on your network, the model number and serial number are included in the unit description to help identify the specific unit.

Arroyo Control

ArroyoControl is a free software program that is included on the disc that comes with your instrument, and provides remote control of all Arroyo Instruments’ controllers. If you are having problems communicating with the instrument, it can be a useful diagnostic step to install and use ArroyoControl to see if the program can successfully communicate with the instrument. If it does, then it demonstrates that the connection and drivers are properly installed.
Using Commands

While the instrument does not have a GPIB interface, the command structure and parsing were
developed around the IEEE-488.2 standard. Most IEEE-488.2 commands are supported, and the
command/response format is consistent with the standard.

When sending commands to the instrument, you must terminate the command string with a carriage
return (ASCII 13) or line feed (ASCII 10, or both. The instrument will not start processing a command, or
go into remote mode until it has received a carriage return or feed command terminator.

Commands are grouped into two major categories: device-independent and device-dependent
commands. Device-independent commands include all the IEEE-488.2 supported commands plus other
commands that are universal across all instruments. Device-dependent commands are specific to a
class of instruments, such as TEC commands for the temperature controller. Not all instruments support
every command. Review the command for instrument-specific differences.

IEEE-488.2 Commands

The following device-independent commands are supported by most instruments:

- *CLS
- *ESE
- *ESE?
- *IDN?
- *IST?
- *OPC
- *OPC?
- *PRE
- *PRE?
- *PSC
- *PSC?
- *RCL
- *RST
- *SAV
- *SRE
- *SRE?
- *STB?
- *WAI

Device-Independent Commands

The following device-independent commands are supported by most instruments:

- BAUD
- BEEP
- BEEP?
- BRIGHT
- BRIGHT?
- CALdate?
- DELAY
- DIO:IN?
- DIO:OUT?
- DIO:OUTMODE
- DIO:OUTMODE?
- EQUIPment?
- ERRORLED
- ERRORLED?
- ERRord?
- ERRSTATE?
- HEXFLOAT
- HEXFLOAT?
- KNOB
- KNOB?
- LOCAL
- MESsage
- MESsage?
- ONDELAY
- ONDELAY?
- RADix
- REMERR
- REMERR?
- REMSET
- REMSET?
- SCRIPT:GET
- SCRIPT:GO
- SCRIPT:PUT
- TERMINAL
- TERMINAL
- TIME
- TIME?
- VER

Device-Dependent Commands

Device-dependent commands are specific to a class of instruments, such as the temperature controller.

Many of the device dependent commands have two commands that do the same thing. For example,
LAS:I? and LAS:LID? perform the same operation. The "I", "IPD", and "Ppd" forms of commands are
considered obsolete but are included for compatibility reasons.

Command Syntax and Concatenation

All commands use a common syntax for constructing the command and parameter passing. Commands are case-insensitive, and some commands have optional characters, which are denoted as lower-case characters in the command definition. For example, LASer:EVEnt? can be shortened to LAS:EVE? This allows for command abbreviation and therefore reduced communication times.

The input buffer of the instrument allows for up to 128 characters to be received before a command overflow error occurs. If a command overflow does occur, the entire buffer is discarded and an E-102 (Message too long) error will occur.

If a command requires one or more parameters, place a space between the command and the first parameter, then use a comma to separate additional parameters. For example, the laser tolerance command might look like:

```
LASER:TOLERANCE 10,25
```

It is also possible to concatenate multiple commands together as a single communication to the instrument. By using a semicolon, multiple commands can be sent to the instrument at once, but command processing will not start until all commands and the command terminator have been received. For example, to set the laser set point to 10mA and turn the output on, the command would look like:

```
LASER:LDI 10;LASER:OUTPUT 1
```

Command Paths

The command set is structured in a tree-like organization, where commands for a common device or function are grouped together. For example, all commands specific to the laser driver start with a “LASer:” prefix. This is called the command path.

When issuing multiple concatenated commands to the instrument, it “remembers” the command path of the previous command, and allows you to omit the common path from the second command. Using the example above where the set point was changed to 10mA and the output turned on, it could also be shortened by omitting the second “LASER:” portion because when the OUTPUT command is processed, the command parser “remembers” its position in the command tree and starts looking for the command at that level. The command could therefore be shortened to this:

```
LASER:LDI 10;OUTPUT 1
```

Removing the optional characters from the commands, you can further shorten the command to:

```
LAS:LDI 10;OUT 1
```

In the case where the same command exists at the last command level and in one or more levels above, you can start the command with a colon (‘:’) to force the command parser to start at the root. For example, take the following command:
LASER:MODE:LDV;LDV 0.5

At first glance, it appears to set the laser into voltage control mode and then set the set point to 0.5V. However, after processing the first command, the parser is at the “LASER:MODE:” level in the command tree and the second “LDV” command will match the “LASER:MODE:LDV” command, basically changing modes twice. To force the parser to interpret the command the way we intended, compose the second command after the semicolon like this:

LASER:MODE:LDV; :LASER:LDV 0.5

Numeric Substitutions

For command readability, you can also substitute alternate values for zero (0) and one (1). “0” can be replaced by “OFF”, “NEW”, or “FALSE”. “1” can be replaced by “ON”, “OLD”, or “TRUE”.

---

### Working with Radixes and Hex Floats

It is possible to change the base coding of decimal values to binary, octal, or hexadecimal (hex) by using the RADIX command. Depending on your programming interface, it may be easier to send or receive data in one of these alternate notations.

The RADIX command only affects data sent by the instrument to the PC; the instrument will always accept values in alternate base values.

Hex values are prefixed with a ‘#H’, octal with a ‘#O’, and binary with a ‘#B’. For example, the decimal value 47635 would be represented as following:

- Binary: #B1011101000010011
- Octal: #O135023
- Hexadecimal: #HBA13

In addition to the binary, octal, and hex, floating point numbers can be transmitted and received in an ‘ASCII-hex’ notation. Transmission of floating-point values over plain text interfaces (such as is used on Arroyo controllers) invariably leads to rounding of the floating point number simply because the plain text interface does not (typically) transmit the full resolution a floating point number is capable of. This does not normally affect operation, and commands to the Arroyo controllers can always include additional resolution to mitigate this.

However, in some applications, it is useful to have the exact floating point value, and the hex float mode enables this. When operating in hex float mode, floating point numbers are transmitted in IEEE 754 notation, starting with a ‘#E’ prefix.

For example, the single-precision float point value 123.45 would be encoded as #E42F6E666. For double-precision values, the hex data would be twice the length, and 123.45 in double-precision hex data would be #E405EDCCCCCCCCCDD.

While the instrument will always accept floating point numbers encoded in hex float, the HEXFLOAT command enabled the transmission of hex float values from the instrument to the PC for those values that are represented in floating point notation (such as measurements and set points). Non-floating point numbers will continue to transmit normally (or in alternate base if selected by the RADIX command).

### Working with Scripts

Script support was added with version 2 of the firmware. It is normally used to load scripts for execution by the instrument’s function keys, but scripts can also be executed remotely.

A script is a series of commands, anything you can normally send to the instrument, but stored in memory for execution at a later time. A script can contain any valid command except:

- DELAY
- *WAI
- SCRIPT:GO
- SCRIPT:PUT

A script can be a maximum of 200 characters and up to four scripts can be stored.

A script can contain more than one command, but there is a slight difference when concatenating commands as compared to normal communications: instead of using a semicolon (;) to separate commands, you must use a carat (^). For example, a script to change the set point to 50mA and turn the output on, stored in position 1, would be stored with the following command:

```plaintext
SCRIPT:PUT 1, LAS:I 50 ^ LAS:OUT ON
```

Notice that a carat separates the two commands, not a semicolon. You can then execute the script remotely with the SCRIPT:GO command:

```plaintext
SCRIPT:GO 1
```

On multi-channel controllers, make sure to include a LAS:CHAN or TEC:CHAN command at the start of the script sequence to ensure the commands are executed on the proper channel.

If your instrument has function keys, you can also assign the script to the function key.

When storing scripts, the instrument will pause for approximately 125ms to perform the storage process. During this time, any communications to the instrument is ignored. It is recommended you include a 150ms delay after sending a SCRIPT:PUT command to prevent communications errors. Alternatively, you can concatenate a query commands (such as ERR?) to the script update command and wait for the reply (e.g., ERR?).

In addition, instruments which implement a software-controlled loop, such as temperature controllers, will also pause control during this window. Timing is narrow, so it will likely have little impact, but a small perturbation of temperature readings may be observed. To avoid this issue, update scripts prior to operating enabling the output.

Commands that are affected by this delay are:

```plaintext
*RST 1
SCRIPT:PUT
```

Note that a *RST (or *RST 0) is not affected, as scripts are only reset when the "1" parameter is included in the command.
Event and Condition Reporting

In order to allow for quick summary reporting of device status, the instruments contain a powerful status reporting structure, which can be configured to report status at several levels of the instrument’s operation. Using the various enable registers, a summary of the instrument’s operation is made into the status byte register, allowing the control application to query only the status byte register, and if no pertinent events or conditions are being reported, no other status checking is needed.

In some cases, condition and event registers may appear to report the same thing, but it is how the registers work that make them unique from each other. A condition register will report the status of the instrument at the moment in time when the condition register is queried. For fast conditions (such as laser over-voltage), it’s not possible to detect the condition no matter how fast you query the instrument. This is where event registers come in: they “remember” their state until you read them. For example, if a laser goes into current limit, then out of current limit, its condition register will indicate current limit only while it is in that state. The event register, however, will set its current limit bit, and that bit will remain set until the event register is read. All event registers, once read, will automatically reset themselves to zero.

For example, if you wanted to monitor if the laser was in current or power limit, if the output turned off, or if there were any error in the error queue, you could enable reporting of current or power limit conditions in the LASer:COND register, and enable the output status change event in the LASer:EVEnt register. By querying the status byte register (*STB?), no further action is necessary if the laser event, laser condition, and error available bits were all zero. If you did not use the status reporting system, you would need to issue at least three commands to do the same thing.

At first glance, the reporting structure pictured below can seem complex, but it is actually quite simple. For each register, there is a corresponding enable register. For example, the laser condition register (LASer:COND) has a laser condition enable register (LASer:ENABle:COND). The two registers are ANDed together, and if the resulting value is non-zero , then the corresponding bit in the status byte register is turned on (in this case, bit 3, the laser condition summary bit).

By reviewing your application needs and the reporting capabilities of the system, you can determine what conditions or event you want to enable and appropriately set each of the enable registers.

In USB and RS232 applications, the Service Request Enable Register, the Parallel Poll Enable Register, and the IST bit have little value because the Status Byte Register will contain more detail, but these registers have been implemented for greater compatibility with existing software applications.

14 - T Limit
15 - Thermal Trip
**Operation Complete Definition**

The term “Operation Complete” is a summary condition which indicates that the instrument has reached a stable, idle operating condition. This includes reaching temperature equilibrium, completing any ramp functions, and other, similar actions which take some amount of time to complete.

This condition is reported in bit 0 of the Standard Event Status Register as the Operation Complete flag, and is also used to control the execution of the *OPC, *OPC?, and *WAI commands. Using the *ESE command, the user can also update bits of the Status Byte Register.

Operation Complete is defined as:

1. The laser controller is idle (no ramp functions).
2. The TEC controller is idle (no ramp functions).
3. No EPROM (non-volatile) memory write cycles are in progress.
4. No delay timeout clocks are running.
5. No calibration routines are running.
6. Laser output is off, or it is on and within tolerance.
7. TEC output is off, or it is on and within tolerance.

**Primary and Auxiliary Sensors**

Many of the TEC commands include a parameter called “sensor index”. This index is used to select the sensor to which the command will change or query.

Some commands are specific to primary or auxiliary sensors. A primary sensor is one that can be used in the control loop to control the temperature of the mount or device. An auxiliary sensor is one that can only be used to monitor a temperature sensor.

For instruments with only a single temperature sensor input, that sensor input is the primary and active sensor, and the sensor index will always be one.

For multi-sensor controllers with more than one primary sensor, only one sensor input can be used to control the temperature, and this is considered the “active” sensor. Other primary sensors not involved in temperature control are called “non-active” primary sensors.

For many commands, the sensor index argument is optional. If omitted from the command, then the sensor index of the primary active sensor is used. This maintains backwards compatibility with existing control programs.
Alphabetical List of Commands

*CLS
Synopsis: Clear status registers command
Syntax: *CLS
Details: Clears the standard event status register, all event registers, and the error queue.
See Also: ESR?, ERR?, *IST?, *STB?

*ESE
Synopsis: Set the Event Status Register Enable
Syntax: *ESE mask
Details: See the ESR? query for a definition of the individual bits with the mask parameter. The mask is logically ANDed with the ESR register, and if any of the resulting bits are high, bit 5 of the STB register (Event Status Summary) is set.
See Also: *ESE?, ESR?, *STB?

*ESE?
Synopsis: Query the Event Status Register Enable
Syntax: *ESE?
Details: Returns the value of the Event Status Register Enable. See the ESR? query for a definition of the individual bits with the response value.
See Also: *ESE, ESR?, *STB?

*ESR?
Synopsis: Query the Event Status Register
Syntax: *ESR?
Details: Returns the value of the Event Status Register. As with all event registers, after the value has been read, the register will be set to zero.

<table>
<thead>

</tr>
</tbody>
</table>
Operation complete indicates when the controller has completed all pending operations and the outputs are stable.

See Also  *ESE, ESE?, *OPC, *STB?

*IDN?
Synopsis Query the instrument identification
Syntax  *IDN?
Details Returns the identification string for the instrument in the following format:

Arroyo Model SN Ver Build

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>

*OPC
Synopsis Operation Complete Command
Syntax  *OPC
Details Sets the operation complete bit in the event status register when the operation complete state is true.

See Also  *ESR?, *OPC?, *WAI

*OPC?
Synopsis Operation Complete Query
Syntax  *OPC?
Details Returns a “1” when the operation complete state is true. The “1” will be inserted asynchronously upon operation complete.

See Also  *OPC, *WAI
**PRE**

**Synopsis**
Set the Parallel Poll Enable Register

**Syntax**
*PRE mask

**Details**
See the STB? query for a definition of the individual bits with the *mask* parameter. The *mask* is logically ANDed with the Status Byte Register, and if any of the resulting bits are high, the ‘ist’ bit is set.

**See Also**
*PRE?, *STB?

---

**PRE?**

**Synopsis**
Query the Parallel Poll Enable Register

**Syntax**
*PRE?

**Details**
Returns the value of the Parallel Poll Enable register. See the STB? query for a definition of the individual bits with response value.

**See Also**
*PRE, *STB?

---

**PSC**

**Synopsis**
Set the Power-On Status Clear

**Syntax**
*PSC enable

**Details**
Enables or disables the power-on clearing of event and condition status enable registers.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>1</td>
<td>All event and condition status enable registers are cleared at power-up.</td>
</tr>
<tr>

<td>0</td>
<td>All event and condition status enable registers are restored their last power-off state.</td>
</tr>
</tbody>
</table>

**See Also**
*PSC?

---

**PSC?**

**Synopsis**
Query the Power-On Status Clear

**Syntax**
*PSC?

**Details**
Returns the value of the Power-On Status Clear register. See the *PSC command for a definition of the response value.

**See Also**
*PSC

---

**RCL**

**Synopsis**
Recall command

**Syntax**
*RCL bin
The *RCL command is used to restore the unit from a saved configuration bin. Bin 0 is a special case, and behaves identically to a *RST command. A configuration recall from an empty bin will generate an error.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin</td>
<td>0</td>
<td>Reset to factory configuration, same as *RST command.</td>
</tr>
<tr>
<td></td>
<td>1 to 4</td>
<td>Recall configuration saved via *SAV command.</td>
</tr>
</tbody>
</table>

**See Also** *RST, *SRE, *SAV

---

### *RST

**Synopsis** Reset command

**Syntax** *RST [all]

**Details** Resets the instrument parameters to factory defaults, and the output is shut off. The unit remains in remote mode. To erase saved configurations, function key assignments, and scripts, the optional all parameter must be set to 1.

Note that user calibration parameters are not changed with any form of the *RST comment. They must be reset with the appropriate USERCAL:RESET command.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all</td>
<td>0</td>
<td>Reset to parameters to factory configuration, excluding saved configurations, function key assignments, and scripts.</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Reset to parameters to factory configuration, including saved configurations, function key assignments, and scripts.</td>
</tr>
</tbody>
</table>

**See Also** *RCL, LASER:USERCAL:RESET, TEC:USERCAL:RESET

---

### *SAV

**Synopsis** Save the instrument configuration

**Syntax** *SAV bin

**Details** Saves the current instrument configuration into one of four bins which can later be recalled using the *RCL command.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>bin</td>
<td>1 to 4</td>
<td>Save bin</td>
</tr>
</tbody>
</table>

**See Also** *RCL

---

### *SRE

**Synopsis** Set the Service Request Enable

**Syntax** *SRE mask

**Details** The *SRE command sets the Service Request Enable Register bits, which control the Master Status Summary bit in the Status Byte Register.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>128</td>
<td>Error Message Available</td>
</tr>
</tbody>
</table>

**See Also**  *SRE?*

---

**SRE?**

**Synopsis**
Query the Service Request Enable

**Syntax**
*SRE?*

**Details**
Returns the value of the Service Request Enable register. See the *SRE command for a definition of the response value.

**See Also**  *SRE*

---

**STB?**

**Synopsis**
Query the Status Byte Register

**Syntax**
*STB?*

**Details**
Returns the value of the Status Byte Register.

<table>
<thead>
<tr>
<th>Response</th>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STB</td>
<td>0</td>

<td>6</td>
<td>64</td>
<td>Request Service / Master Status Summary</td>
</tr>
<tr>
<td></td>
<td>7</td>
<td>128</td>
<td>Error Message Available</td>
</tr>
</tbody>
</table>

**See Also**  *SRE, *PRE*

---

**WAI**

**Synopsis**
Wait for Operation Complete command

**Syntax**
*WAI*

**Details**
The *WAI command will pause command processing until the Operation Complete flag is true.

---

**BAUD**

**Synopsis**
Sets the baud rate on RS232 interfaces
Syntax | BAUD baudrate
---|---
Details | Changes the baud rate on RS232 interfaces. After sending the command, the baud rate will immediately be adjusted to the new speed, so if you are communicating over RS232, you must also change the PC-side baud rate to match.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>baudrate</td>
<td>300</td>
<td>300 baud</td>
</tr>
<tr>

<td>19,200 baud</td>
</tr>
<tr>
<td></td>
<td>38400</td>
<td>38,400 baud</td>
</tr>
<tr>
<td></td>
<td>57600</td>
<td>57,600 baud</td>
</tr>
<tr>
<td></td>
<td>115200</td>
<td>115,200 baud</td>
</tr>
</tbody>
</table>

BEEP

Synopsis | Set the beep enable
Syntax | BEEP [enable]
Details | Causes the instrument to beep, or enables or disabled the beep sound for error messages and other events that generate and audible response. If enable is omitted, it is the equivalent of doing a ‘BEEP 2’.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disable the beep sound</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enable the beep sound</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Generate one beep</td>
</tr>
</tbody>
</table>

See Also | BEEP?

BEEP?

Synopsis | Query the beep enable
Syntax | BEEP?
Details | Returns the value of the Beep register.

<table>
<thead>
<tr>
<th>Response</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disable the beep sound</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enable the beep sound</td>
</tr>
</tbody>
</table>

See Also | BEEP

BRIGHT

Synopsis | Set the display brightness
Syntax | BRIGHT brightness [, autodim]
Details | Sets the display brightness level, from 0 to 100 percent, and optionally enables or disables automatic display dimming (only on supported units).
### Argument Value Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>brightness</td>
<td>0 to 100</td>
<td>Brightness level of the display</td>
</tr>
<tr>
<td>autodim</td>
<td>0 or 1</td>
<td>0 to disable, 1 to enable</td>
</tr>
</tbody>
</table>

On some displays, such as VFDs, there may only be 4 or 8 brightness levels, and the `brightness` parameter will be used to select an appropriate level.

The `autodim` functionality is only supported on version 3.x firmware. If `autodim` is enabled, display will be dimmed to its lowest point after 1 hour of front panel inactivity.

### See Also

BRIGHT?

### BRIGHT?

**Synopsis**

Query the display brightness

**Syntax**

BRIGHT?

**Details**

Returns the value of the display brightness. See the BRIGHT command for more details.

**See Also**

BRIGHT

### CALdate?

**Synopsis**

Query the calibration date

**Syntax**

CALdate?

**Details**

Returns the date string of the last calibration.

### DELAY

**Synopsis**

Causes a delay in command processing

**Syntax**

DELAY time

**Details**

Causes command processing to be delayed for the specified number of milliseconds.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>1 to 30000</td>
<td>Delay, in milliseconds</td>
</tr>
</tbody>
</table>

### DIO:IN?

**Synopsis**

Query the state of the auxiliary digital input

**Syntax**

DIO:IN? port

**Details**

Returns the state of a specific auxiliary digital input port.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Interlock</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital input pin</td>
</tr>
</tbody>
</table>

The return value will be zero if in the input is low (or interlock is shorted), 1 if the input is high (or the interlock is open). An unconnected digital input may be high or low,
depending on the electrical configuration of the port. See the user’s manual for more details.

Only supported on multi-channel instruments that feature digital input capability.

See Also  
DIO:OUT?

DIO:OUT?
Synopsis  
Query the state of the auxiliary digital output

Syntax  
DIO:OUT? port

Details  
Returns the state of a specific digital output port.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Relay</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital output pin</td>
</tr>
</tbody>
</table>

The return value will be zero if in the output is low (or the relay is open), 1 if the output is high (or the relay is closed).

Only supported on multi-channel instruments that feature digital output capability.

See Also  
DIO:IN?, DIO:OUTMODE

DIO:OUTMODE
Synopsis  
Set the auxiliary digital output mode

Syntax  
DIO:OUTMODE port, function

Details  
Selects the function setting for a specific output port. Output ports can be turned off or on, or used as summary state for the corresponding digital outputs of all the channels in the system.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Relay</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital output pin</td>
</tr>
<tr>
<td>function</td>
<td>0</td>
<td>Pin output low (off)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Pin output high (on)</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Pin output high (on) if all channel digital outputs are low</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>Pin output high (on) if any channel digital outputs are high</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>Pin output high (on) if all channel digital outputs are high</td>
</tr>
</tbody>
</table>

Only supported on multi-channel instruments that feature digital output capability. Some features, such as the relay output, are not supported on all instruments, check the user’s manual for more details.

See Also  
DIO:OUTMODE?

DIO:OUTMODE?
Synopsis  
Query the auxiliary digital output mode

Syntax  
DIO:OUTMODE? port
Details

Returns the output mode and invert setting for a specific output port. See DIO:OUTMODE for a definition of the port argument and function response values.

Only supported on multi-channel instruments that feature digital output capability.

See Also

DIO:OUTMODE

---

EQUIPment?

Synopsis

Query for installed equipment

Syntax

EQUIPment?

Details

The EQUIPment? query returns a comma-separated list of installed modules, which is model number from each module. For modular controllers, the first parameter is the model number of the chassis, followed by the model numbers of each module. For single channel instruments, it returns the model number of the instrument.

---

ERRORLED

Synopsis

Turn the Error LED On/Off

Syntax

ERRORLED state

Details

If the ERRORLEDMODE is set to 1, this command can be used to turn on or off the Error LED. To turn off the Error LED, the error queue must be empty or the command will be ignored. To ensure the Error LED turns off, issue an "ERR?" before (or with) an "ERRORLED 0" to clear the queue before turning off the LED.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>0</td>
<td>Turn off the Error LED</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Turn on the Error LED</td>
</tr>
</tbody>
</table>

This setting does not persist across power cycles. In other words, if an “ERRORLED 1” is sent to turn on the Error LED, after the unit is turned off and back on, the Error LED will not relight unless another “ERRORLED 1” command is sent or an actual error occurs.

See Also

ERRORLED?, ERRORLEDMODE

---

ERRORLED?

Synopsis

Returns the state of the Error LED

Syntax

ERRORLED?

Details

Returns the state of the Error LED, regardless of the ERRORLEDMODE.

<table>
<thead>
<tr>
<th>Response</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>0</td>
<td>Error LED is off</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Error LED is on</td>
</tr>
</tbody>
</table>

See Also

ERRORLED
**ERRORLEDMODE**

**Synopsis**
Sets the Error LED Mode

**Syntax**
ERRORLEDMODE mode

**Details**
When the ERRORLEDMODE is set to 1, whenever an error is displayed by the instrument, the Error LED will remain on (persist) until an the error queue is emptied and an “ERRORLED 0” command is sent to the instrument. The ERRORLEDMODE is a persistent setting, meaning it will remain in effect across power-cycles. Then in addition, when the ERRORLEDMODE is set to 1, the ERRORLED command can be used to manually turn on the Error LED.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>0</td>
<td>Disables persistent Error LED</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables persistent Error LED</td>
</tr>
</tbody>
</table>

When in remote mode, REMERR must be set to 1 for this function to work, as REMERR 0 suppresses error display in remote mode.

**See Also**
ERRORLED, ERRORLEDMODE?, REMERR

**ERRORLEDMODE?**

**Synopsis**
Returns the state of the Error LED Mode

**Syntax**
ERRORLED?

**Details**
Returns the state of the Error LED Mode.

<table>
<thead>
<tr>
<th>Response</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>0</td>
<td>Persistent Error LED Mode disabled</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Persistent Error LED Mode enabled</td>
</tr>
</tbody>
</table>

**See Also**
ERRORLEDMODE

**ERRors?**

**Synopsis**
Query for errors

**Syntax**
ERRors?

**Details**
Returns a comma–delimited list of error codes. If no error has occurred, a 0 is returned.

A typical response might look like:

```
201,124
```

**See Also**
ERRSTR?

**ERRSTR?**

**Synopsis**
Query for errors with string descriptions
Syntax ERRSTR?

Details Similar to the ERR? query, but a string description is included with the error code. A typical response might look like:

201,"Out of range",124,"Data mismatch"

See Also ERR?

HEXFLOAT

Synopsis Enables the hex float mode

Syntax HEXFLOAT enable

Details Enables transmission of hex floats from the instrument. See the section Working with Radixes and Hex Floats for more information on this mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Hex float mode disabled</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Hex float mode enabled</td>
</tr>
</tbody>
</table>

See Also HEXFLOAT?

Support This function is only available in firmware version 2.0 and later.

HEXFLOAT?

Synopsis Query the state of the hex float mode

Syntax HEXFLOAT?

Details Returns the enable state of hex mode. See the HEXFLOAT command for more details.

Only supported on 6300 Series, 4400 and 4200-DR Series controllers.

See Also HEXFLOAT

Support This function is only available in firmware version 2.0 and later.

KNOB

Synopsis Controls the front panel knob lockout and acceleration modes

Syntax KNOB lockout, speed

Details Enables front panel knob lockout and acceleration modes.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lockout</td>
<td>0</td>
<td>Disables front panel knob lockout</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables front panel knob lockout</td>
</tr>
<tr>
<td>speed</td>
<td>0</td>
<td>Slow</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Medium</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Fast</td>
</tr>
</tbody>
</table>
This mirrors the Lockout Knob and Knob Speed settings in the System Menu and supersedes Set While Remote (REMSET).

See Also  KNOB?

Support  This function is only available in firmware version 3.17 and later.

---

### KNOB?

**Synopsis**  Query the front panel knob lockout and acceleration modes

**Syntax**  KNOB?

**Details**  Returns the front panel knob lockout and acceleration mode. See the KNOB command for more details.

See Also  KNOB

Support  This function is only available in firmware version 3.17 and later.

---

### LASer:AFILTER

**Synopsis**  Enable or disable the analog filter

**Syntax**  LASer:AFILTER enable

**Details**  This command enables or disables the analog filter in low bandwidth constant current mode. This is only supported on specific instruments, such as the 4400 LaserSource, see the User’s Manual for more information on its use.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0 or 1</td>
<td>Disables (0) or enables (1) the analog filter in low bandwidth mode.</td>
</tr>
</tbody>
</table>

See Also  LASer:AFILTER?

Support  This function is only available in firmware version 3.17 and later, and only on controllers that support disabling of the analog filter.

---

### LASer:AFILTER?

**Synopsis**  Query the state of the analog filter

**Syntax**  LASer:AFILTER?

**Details**  Returns the enable state of the analog filter. See the LASer:AFILTER command for more details.

See Also  LASer:AFILTER

Support  This function is only available in firmware version 3.17 and later, and only on controllers that support disabling of the analog filter.

---

### LASer:AUX?

**Synopsis**  Query the auxiliary voltage inputs
Syntax

```
LASer:AUX? [sensor index]
```

Details

Returns the voltage (in volts) measured by the auxiliary voltage inputs. Only certain instruments (such as the LaserPak or 4400) support these inputs, see your instrument manual for details. For instruments that feature multiple auxiliary inputs, the `sensor index` argument specifies which input to return.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>sensor index</code></td>
<td>1 to max</td>
<td>Returns the auxiliary input voltage</td>
</tr>
</tbody>
</table>

If the auxiliary input is configured to be used as a temperature input, use the LAS:R? and LAS:T? queries to return the resistance or temperature measurement, respectively.

See Also

LASer:R?, LASer:T?

Support

Only supported on controllers with auxiliary inputs, such as the 485 LaserPak and 4400 LaserSource. See your controller manual for more information.

---

**LASer:CABLER**

**Synopsis**

Set cable resistance compensation

**Syntax**

```
LASer:CABLER resistance
```

**Details**

Set the cable resistance to adjust the voltage measurement to display the voltage at the laser, compensating for the voltage losses in the cable and connectors. See your instrument manual for additional information on using this feature.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>resistance</code></td>
<td>0.00 to 10.0000</td>
<td>Cable resistance, in ohms</td>
</tr>
</tbody>
</table>

**See Also**

LASer:CABLER?

---

**LASer:CABLER?**

**Synopsis**

Query the cable resistance compensation

**Syntax**

```
LASer:CABLER?
```

**Details**

Returns the value of the cable resistance compensation value. See the LASer:CABLER command for more details.

**See Also**

LASer:CABLER

---

**LASer:CALMD (CALPD)**

**Synopsis**

Set photodiode optical response

**Syntax**

```
LASer:CALMD PDresp
```

**Details**

Set the photodiode optical response value for converting photodiode current into optical power. This is the PD Response value from the instrument menu.
If $PD_{resp}$ is zero, then power mode will be unavailable, and the instrument will display photodiode current. If $PD_{resp}$ is non-zero, then power mode will be allowed, and the instrument will display optical power.

**Synopsis**
Laser calibration functions

**Details**
See the calibration section for details on how to use these commands.

---

**LASer:CHAN**

**Synopsis**
Set the laser channel

**Syntax**
LASer:CHAN channel

**Details**
For controllers with more than one laser channel, the LASer:CHAN command selects the active channel.

**Argument** | **Description**
--- | ---
channel | Laser channel, from 1 to max

**See Also**
LASer:CHAN?

---

**LASer:CHAN?**

**Synopsis**
Returns the active laser channel

**Syntax**
LASer:CHAN?

**Details**
Returns the active laser channel in a multi-channel laser controller.

**See Also**
LASer:CHAN
LASer:COND?
Synopsis  Query laser condition
Syntax    LASer:COND?
Details   Returns the laser condition register.

LASer:CONST
Synopsis  Set the Steinhart-Hart temperature conversion constants
Syntax    LASer:CONST A, B, C
Details   Sets the constants used in converting the resistance of auxiliary temperature inputs to °C using the Steinhart-Hart formula. By default, the thermistor constants are set to those for a BetaTHERM 10K3A1 thermistor.

<table>
<thead>
<tr>
<th>Argument</th>

</tr>
<tr>
<td>C</td>
<td>± 9.9999</td>
<td>Third Steinhart-Hart constant (x 10^-5)</td>
</tr>
</tbody>
</table>

Some vendors may refer to A, B, and C as C1, C2, & C3.

See your user’s manual for more information on using this function.

See Also  LASer:CONST?

LASer:CONST?
Synopsis  Query the Steinhart-Hart temperature conversion constants
Syntax    LASer:CONST?
Details
Returns the sensor temperature conversion constants. See the LASer:CONST command for a complete definition of the A, B, and C response values.

See Also
LASer:CONST

---

**LASer:DC**

**Synopsis**
Set the duty cycle in QCW mode

**Syntax**
LASer:DC dutycycle

**Details**
This changes the duty cycle percentage when in QCW mode. A new frequency value will be computed based on the duty cycle and pulse width (the pulse width is not changed). If the resulting frequency is outside the allowable range, an E-201 error will be generated and the command ignored.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dutycycle</td>
<td>Duty cycle, in percent</td>

**Support**
Only supported on QCW-equipped controllers.

---

**LASer:DC?**

**Synopsis**
Query the QCW duty cycle

**Syntax**
LASer:DC?

**Details**
Returns the value of the duty cycle. See LASer:DC for a definition of the dutycycle response value.

**See Also**
LASer:DC

**Support**
Only supported on QCW-equipped controllers.

---

**LASer:DEC**

**Synopsis**
Decrement the laser set point

**Syntax**
LASer:DEC steps [, time]

**Details**
The LASer:DEC command uses the step size defined with the LASer:STEP command to decrement the laser set point. If the time parameter is omitted, then the set point is immediately decremented steps times the step size. If the time parameter is included, then the instrument will still decrement steps times the step size, but will pause at each step for time milliseconds.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>steps</td>
<td>1 to 65000</td>
<td>Number of steps to decrement</td>

</tr>
</tbody>
</table>

**See Also**
LASer:INC, LASer:STEP
**LASer:DELAYIN**

**Synopsis**
Set the pulse delay, in seconds, between the trigger input and output pulse.

**Syntax**
LASer:DELAYIN delay

**Details**
Sets the delay from the rising edge of TRIGIN to the generation of the output pulse in QCW mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>delay</td>
<td>0.000015 to 1</td>
<td>Delay, in seconds</td>
</tr>
</tbody>
</table>

**See Also**
LASer:DELAYIN?, LASer:DELAYOUT

**LASer:DELAYIN?**

**Synopsis**
Query the trigger input pulse delay.

**Syntax**
LASer:DELAYIN?

**Details**
Returns the value of the trigger input delay. See LASer:DELAYIN for a definition of the delay response value.

**See Also**
LASer:DELAYIN

**Support**
Only supported on QCW-equipped controllers.

**LASer:DELAYOUT**

**Synopsis**
Set the trigger output delay, in seconds, between the output pulse and the trigger output.

**Syntax**
LASer:DELAYOUT delay

**Details**
Sets the delay from the rising edge of the pulse to the rising edge of TRIGOUT in QCW mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>delay</td>
<td>0.000000 to 1</td>
<td>Delay, in seconds</td>
</tr>
</tbody>
</table>

**See Also**
LASer:DELAYOUT?, LASer:DELAYIN

**Support**
Only supported on QCW-equipped controllers.

**LASer:DELAYOUT?**

**Synopsis**
Query the trigger output delay.

**Syntax**
LASer:DELAYOUT?

**Details**
Returns the value of the trigger output delay. See LASer:DELAYOUT for a definition of the delay response value.

**See Also**
LASer:DELAYOUT

**Support**
Only supported on QCW-equipped controllers.
**LASer:DIO:IN?**

**Synopsis**
Query the state of a digital input

**Syntax**
LASer:DIO:IN? port

**Details**
Returns the state of a specific digital input port.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Interlock</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital input pin</td>
</tr>
</tbody>
</table>

The return value will be zero if in the input is low (or interlock is shorted), 1 if the input is high (or the interlock is open). An unconnected digital input may be high or low, depending on the electrical configuration of the port. See the user’s manual for more details.

Only supported on instruments that feature digital input capability.

**See Also**
LASer:DIO:INMODE

---

**LASer:DIO:INMODE**

**Synopsis**
Set the digital input mode

**Syntax**
LASer:DIO:INMODE port, function [,invert]

**Details**
Selects the function and invert setting for a specific input port. Input ports can be used as additional interlocks (function 1), or to remotely control the on/off state of the instrument (function 2). The invert setting is used to control if the function is active when the pin is high (invert 0) or when the pin is low (invert 1). Chassis interlock only supports an invert setting of 0

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Chassis interlock input</td>
</tr>
<tr>
<td></td>

<td>3</td>
<td>Trigger</td>
</tr>
<tr>
<td>invert</td>
<td>0</td>
<td>No logic inversion (function is active high)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Inverted logic (function is active low)</td>
</tr>
</tbody>
</table>

Only supported on instruments that feature digital input capability.

**See Also**
LASer:DIO:IN?

---

**LASer:DIO:INMODE?**

**Synopsis**
Query the digital input mode

**Syntax**
LASer:DIO:INMODE? port

**Details**
Returns the input mode and invert setting for a specific input port. See LASer:DIO:INMODE for a definition of the port argument and function and invert response values.
Only supported on instruments that feature digital input capability.

**See Also** LASer:DIO:INMODE

---

**LASer:DIO:OUT?**

**Synopsis** Query the state of a digital output

**Syntax** LASer:DIO:OUT? port

**Details** Returns the state of a specific digital output port.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Relay</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital output pin</td>
</tr>
</tbody>
</table>

The return value will be zero if in the output is low (or the relay is open), 1 if the output is high (or the relay is closed).

Only supported on instruments that feature digital output capability.

**See Also** LASer:DIO:OUTMODE

---

**LASer:DIO:OUTMODE**

**Synopsis** Set the digital input mode

**Syntax** LASer:DIO:OUTMODE port, function [,invert]

**Details** Selects the function and invert setting for a specific output port. Output ports can be used to signal various instrument states or directly controlled. The invert setting is used to control if the pin is set to high function is active (invert 0) or low (invert 1). The relay only supports an invert setting of zero.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Relay</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital output pin</td>
</tr>
<tr>
<td>function</td>
<td>0</td>
<td>Pin output low (off)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Pin output high (on)</td>

</tr>
<tr>
<td>invert</td>
<td>0</td>
<td>No logic inversion (pin is high if function is active)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Inverted logic (pin is low if function is active)</td>
</tr>
</tbody>
</table>

The invert setting is ignored when the function is 0 or 1.

Only supported on instruments that feature digital output capability.

**See Also** LASer:DIO:OUTMODE?, LASer:DIO:OUT
**LASer:DIO:OUTMODE?**

**Synopsis**
Query the digital output mode

**Syntax**
`LASer:DIO:OUTMODE? port`

**Details**
Returns the output mode and invert setting for a specific output port. See `LASer:DIO:OUTMODE` for a definition of the `port` argument and `function` and `invert` response values.

Only supported on instruments that feature digital output capability.

**See Also**
`LASer:DIO:OUTMODE`

---

**LASer:DISplay**

**Synopsis**
Set laser display enable

**Syntax**
`LASer:DISplay enable`

**Details**
The `LASer:DISplay` command can be used to completely lock out local operation of the instrument and display "Display Disabled" instead of the normal display.

<table>
<thead>
<tr>
<th>Response</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disables the display and front panel</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables the display and front panel</td>
</tr>
</tbody>
</table>

Once the display is disabled, the front panel is completely locked out. The only way to restore functionality to the front panel is to issue a "LASer:DISplay 1" or cycle power on the unit.

**See Also**
`LASer:DISplay?`

---

**LASer:DISplay?**

**Synopsis**
Query the display enable state

**Syntax**
`LASer:DISplay?`

**Details**
Returns the value of the laser display enable state. See `LASer:DISplay` for a definition of the `enable` response value.

**See Also**
`LASer:DISplay`

---

**LASer:ENABLe:COND**

**Synopsis**
Set Laser Condition Enable register

**Syntax**
`LASer:ENABLe:COND conditions`

**Details**
Enables reporting of selected conditions to the Status Byte Register. See the `LASer:COND` command for a definition of the `conditions` parameter.

**See Also**
`LASer:ENABLe:COND?`, `LASer:COND?`
**LASer:ENABle:COND?**

**Synopsis**
Query Laser Condition Enable register

**Syntax**
LASer:ENABle:COND?

**Details**
Returns the value of the Laser Condition Enable register. See the LASer:COND command for a definition of the *conditions* response.

**See Also**
LASer:ENABle:COND, LASer:COND?

---

**LASer:ENABle:EVEnt**

**Synopsis**
Set Laser Event Enable register

**Syntax**
LASer:ENABle:EVEnt *events*

**Details**
Enables reporting of selected events to the Status Byte Register. See the LASer:EVEnt command for a definition of the *events* parameter.

**See Also**
LASer:ENABle:EVEnt?, LASer:EVEnt?

---

**LASer:ENABle:EVEnt?**

**Synopsis**
Query Laser Event Enable register

**Syntax**
LASer:ENABle:EVEnt?

**Details**
Returns the value of the Laser Event Enable register. See the LASer:EVEnt command for a definition of the *events* response.

**See Also**
LASer:ENABle:EVEnt, LASer:EVEnt?

---

**LASer:ENABle:OUTOFF**

**Synopsis**
Set the Output Off Enable register

**Syntax**
LASer:ENABle:OUTOFF *outoff*

**Details**
The Output Off register controls what conditions will cause the laser output to be turned off. Some conditions are always enabled, as indicated below. The factory default conditions are shown in **bold**.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Bit</th>
<th>Value</th>
<th>Description</th>

See Also  \texttt{LASer:FIXTURELED}?

Support  Only supported on laser controllers with Fixture LED functionality.

---

\textbf{LASer:FIXTURELED?}

Synopsis  Query the fixture LED mode

Syntax  \texttt{LASer:FIXTURELED?}

Details  Returns the value of the fixture LED mode. See \texttt{LASer:FIXTURELED} for a definition of the \textit{mode} response value.

See Also  \texttt{LASer:FIXTURELED}

Support  Only supported on laser controllers with Fixture LED functionality.

---

\textbf{LASer:LINKEDTEC}

Synopsis  Sets the TEC used for TEC off or TEC temperature limit detection

Syntax  \texttt{LASer:LINKEDTEC \textit{tec channel}}

Details  For combination controllers that feature both laser and TEC channels, the laser can automatically be turned off if the TEC is off or reaches a temperature limit. On multi-channel controllers, laser channel 1 is connected to TEC channel 1; laser channel 2 is connected to TEC channel 2; and so on. This command allows multiple laser channels to be configured to use the a single TEC channel.

<table>
<thead>
<tr>

See Also  \texttt{LASer:LINKEDTEC?}

Support  Only supported on multi-channel combination controllers that have more than one laser and TEC channel.

---

\textbf{LASer:LINKEDTEC?}

Synopsis  Query the TEC channel used for monitoring

Syntax  \texttt{LASer:LINKEDTEC?}
Details

Returns the TEC channel used for automatic laser shutdown on TEC output off or temperature limit. See LASer:LINKEDTEC for a definition of the tec channel response value.

See Also

LASer:LINKEDTEC

Support

Only supported on multi-channel combination controllers that have more than one laser and TEC channel.

LASer:INC

Synopsis

Increment the laser set point

Syntax

LASer:INC steps [, time]

Details

The LASer:INC command uses the step size defined with the LASer:STEP command to increment the laser set point. If the time parameter is omitted, then the set point is immediately incremented steps times the step size. If the time parameter is included, then the instrument will still increment steps times the step size, but will pause at each step for time milliseconds.

<table>
<thead>
<tr>

**Synopsis**  Set the laser current resolution

**Syntax**  LASer:LDIRES \textit{resolution}

**Details**  The LASer:LDIRES sets the laser current resolution for both the set point and measurement. An error will be generated if the value of \textit{resolution} is not supported. See the LASer:LDIRESAVAIL? query to get a list of supported values.

<table>
<thead>
<tr>

<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textit{resolution}</td>
<td>\text{Model-specific}</td>
<td>Sets the resolution in milliamps</td>
</tr>
</tbody>
</table>

This function is only available in firmware version 2.0 and later.

See Also  LASer:LDIRES?, LASer:LDIRESAVAIL?

Support  This function is only available in firmware version 2.0 and later.

---

**LASer:LDIRES?**

**Synopsis**  Query the laser current resolution value

**Syntax**  LASer:LDIRES?
Details

Returns the laser current resolution value.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resolution</td>
<td>The resolution value, in milliamps</td>
</tr>
</tbody>
</table>

See Also

LASer:LDIRES, LASer:LDIRESAVAL?

Support

This function is only available in firmware version 2.0 and later.

### LASer:LDIRESAVAL?

**Synopsis**
Query the list of available laser current resolution values

**Syntax**

```
LASer:LDIRESAVAL?
```

**Details**

Returns a list of available current resolutions, which can be used with the LASer:LDIRES command to change the laser current set point and measurement resolution.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Support

This function is only available in firmware version 2.0 and later.

### LASer:LDV

**Synopsis**
Set the laser voltage set point

**Syntax**

```
LASer:LDV setpoint
```

**Details**

The LASer:LDV sets the laser voltage set point.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setpoint</td>
<td>0 to ( V_{\text{limit}} )</td>
<td>Set the voltage set point in volts</td>
</tr>
</tbody>

See Also

LASer:LIMit:LDV?, LASer:LDV?, LASer:SET:LDV?

### LASer:LDV?

**Synopsis**
Query the laser actual voltage

**Syntax**

```
LASer:LDV?
```

**Details**

Returns the actual laser voltage.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>voltage</td>
<td>Actual laser voltage, in volts</td>
</tr>
</tbody>
</table>

See Also

LASer:LIMit:LDV, LASer:LDV

### LASer:LIMit:LDI (I)

**Synopsis**
Set the laser current limit
Syntax  LASer:LIMit:LDI limit

Details  The LASer:LDI sets the laser current limit. If the laser current set point is greater than the value of limit, then laser current set point will be reduced to the value of limit.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>0 to ( l_{\text{max}} )</td>
<td>Set the laser current limit in milliamps</td>
</tr>
</tbody>
</table>

See Also  LASer:LDI, LASer:LIMit:LDI?

**LASer:LIMit:LDI? (I?)**

Synopsis  Query the laser current limit

Syntax  LASer:LIMit:LDI?

Details  Returns the value of the laser current limit. See LASer:LIMit:LDI for a definition of the limit response value.

See Also  LASer:LIMit:LDI

**LASer:LIMit:LDV**

Synopsis  Set the laser voltage limit

Syntax  LASer:LIMit:LDV limit

Details  The LASer:LIMit:LDV sets the laser voltage limit. If the laser voltage set point is greater than the value of limit, then laser voltage set point will be reduced to the value of limit.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>

See Also
LASer:LIMit:MDI?, LASer:MDI

**LASer:LIMit:MDI? (IPD?)**

**Synopsis**
Query the photodiode current limit

**Syntax**
LASer:LIMit:MDI?

**Details**
Returns the value of the photodiode current limit. See LASer:LIMit:MDI for a definition of the limit response value.

See Also
LASer:LIMit:MDI, LASer:MDI

**LASer:LIMit:MDP (Ppd)**

**Synopsis**
Set the photodiode power limit

**Syntax**
LASer:LIMit:MDP limit

**Details**
The LASer:LIMit:MDP sets the photodiode power limit. If the photodiode power set point is greater than the value of limit, then photodiode power set point will be reduced to the value of limit.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>

LASer:LIMit:MDP?, LASer:MDP

**LASer:LIMit:MDP? (Ppd?)**

**Synopsis**
Query the photodiode power limit

**Syntax**
LASer:LIMit:MDP?

**Details**
Returns the value of the photodiode power limit. See LASer:LIMit:MDP for a definition of the limit response value.

See Also
LASer:LIMit:MDP, LASer:MDP

**LASer:LIMit:RHIgh**

**Synopsis**
Set the high resistance limit

**Syntax**
LASer:LIMit:RHIgh limit, [sensor index]

**Details**
The LASer:LIMit:RHI sets the upper resistance limit for auxiliary temperature sensor measurements. If the measured resistance from the temperature sensor exceeds the high limit, and the corresponding bit is enabled in the OUTOFF register, the laser output will be turned off.
Argument  | Value  | Description
----------|--------|-------------
limit     | 0 to 50000 | Set the high resistance limit, in ohms
sensor index | 1 to max | Sensor channel (if omitted, defaults to 1)

See Also  | LASer:ENABLE:OUTOFF, LASer:LIMIT:RHIgh?, LASer:RLOw

Support  | This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

**LASer:LIMIT:RHIgh?**

**Synopsis**  
Query the high resistance limit

**Syntax**  
LASer:LIMIT:RHIgh? [sensor index]

**Details**  
Returns the value of the high resistance limit. See LASer:LIMIT:RHIgh for a definition of the limit response value.

**See Also**  
LASer:LIMIT:RHIgh

**Support**  
This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

**LASer:LIMIT:RLOw**

**Synopsis**  
Set the low resistance limit

**Syntax**  
LASer:LIMIT:RLOw limit, [sensor index]

**Details**  
The LASer:LIMIT:RLO sets the lower resistance limit for auxiliary temperature sensor measurements. If the measured resistance from the temperature sensor exceeds the low limit, and the corresponding bit is enabled in the OUTOFF register, the laser output will be turned off.

| Argument  | Value  | Description
|-----------|--------|-------------
| limit     | -99 to +250 | Set the low temperature limit, in °C
| sensor index | 1 to max | Sensor channel (if omitted, defaults to 1)

**See Also**  
LASer:ENABLE:OUTOFF, LASer:LIMIT:RLOw?, LASer:RLOw

**Support**  
This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

**LASer:LIMIT:RLOw?**

**Synopsis**  
Query the low resistance limit

**Syntax**  
LASer:LIMIT:RLOw? [sensor index]

**Details**  
Returns the value of the low resistance limit. See LASer:LIMIT:RLOw for a definition of the limit response value.
**Argument** | **Value** | **Description**
--- | --- | ---
sensor index | 1 to max | Sensor channel (if omitted, defaults to 1)

**See Also**
LASer:LIMit:RLOw

**Support**
This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

---

**LASer:LIMit:THIgh**

**Synopsis**
Set the high temperature limit

**Syntax**
LASer:LIMit:THIgh *limit*, [sensor index]

**Details**
The LASer:LIMit:THI sets the upper temperature limit for auxiliary temperature sensor measurements. If the measured temperature from the temperature sensor exceeds the high limit, and the corresponding bit is enabled in the OUTOFF register, the laser output will be turned off.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>limit</td>
<td>-99 to +250</td>
<td>Set the low temperature limit, in °C</td>

---

**LASer:LIMit:TLOw**

**Synopsis**
Set the low temperature limit

**Syntax**
LASer:LIMit:TLOw *limit*, [sensor index]

**Details**
The LASer:LIMit:TLO sets the lower temperature limit for auxiliary temperature sensor measurements. If the measured temperature from the temperature sensor exceeds the low limit, and the corresponding bit is enabled in the OUTOFF register, the laser output will be turned off.
Argument | Value | Description
--- | --- | ---
*limit* | -99 to +250 | Set the low temperature limit, in °C
*sensor index* | 1 to max | Sensor channel (if omitted, defaults to 1)

- LASer:ENABLE:OUTOFF, LASer:LIMit:TLOw?, LASer:TLOw

Support
This function is only supported for controllers with auxiliary temperature inputs. See your controller's manual for more information.

### LASer:LIMit:TLOw?

**Synopsis**
Query the low temperature limit

**Syntax**
LASer:LIMit:TLOw? [sensor index]

**Details**
Returns the value of the low temperature limit. See LASer:LIMit:TLOw for a definition of the *limit* response value.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>sensor index</em></td>
<td>1 to max</td>
<td>Sensor channel (if omitted, defaults to 1)</td>

</tr>
</tbody>
</table>

### See Also

## LASe:MODE:BURST

### Synopsis

Set operational mode to laser current control, QCW burst.

### Syntax

```
LASe:MODE:BURST
```

### Details

Switches the Laser driver to laser current control mode, QCW burst. Pulses are triggered with a LASe:TRIGGER command or via the external trigger. The number of pulses is controlled by the LASe:QCWCOUNT command. If the mode is being changed and the laser output is on, the laser output will be turned off and an error generated.

Details
Switches the Laser driver to photodiode current control mode. If the mode is being changed and the laser output is on, the laser output will be turned off and an error generated.

See Also
LASer:MODE?

**LASer:MODE:MDP (Ppd)**

**Synopsis**
Set operational mode to photodiode power control

**Syntax**
LASer:MODE:MDP

**Details**
Switches the Laser driver to photodiode power control mode. If the mode is being changed and the laser output is on, the laser output will be turned off and an error generated.

See Also
LASer:MODE?

**LASer:MODE:PULSE**

**Synopsis**
Set operational mode to laser current control, QCW mode, internal trigger

**Syntax**
LASer:MODE:PULSE

**Details**
Switches the Laser driver to laser current control mode, QCW. Pulses are internally generated using the pulse width, duty cycle, and frequency settings. If the mode is being changed and the laser output is on, the laser output will be turned off and an error generated.

See Also
LASer:MODE?

Support
Only supported on QCW-equipped controllers.

**LASer:MODE:TRIG**

**Synopsis**
Set operational mode to laser current control, QCW mode, external trigger

**Syntax**
LASer:MODE:TRIG

**Details**
Switches the Laser driver to laser current control mode, QCW. Pulses are externally triggered with the TRIGIN signal. Each rising edge of TRIG in generates one pulse. Pulse width is determined by the pulse width setting. Duty cycle and frequency are ignored. If the mode is being changed and the laser output is on, the laser output will be turned off and an error generated.

See Also
LASer:MODE?

Support
Only supported on QCW-equipped controllers.

**LASer:OUTput**

**Synopsis**
Set the laser output state

**Syntax**
LASer:OUTput *state*

**Details**
Turns the laser output on or off.
**LASer:OUTput?**

**Synopsis**
Query the laser output state

**Syntax**
LASer:OUTput?

**Details**
Returns the value of the laser current limit. See LASer:OUT for a definition of the state response value.

**See Also**
LASer:OUTput

---

**LASer:PDBias**

**Synopsis**
Set the photodiode bias voltage set point

**Syntax**
LASer:PDBias voltage

**Details**
Sets the photodiode bias voltage set point.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>voltage</td>
<td>0 to 5</td>
<td>Negative voltage bias set point, in volts</td>
</tr>
</tbody>
</table>

**See Also**
LASer:PDBias?

---

**LASer:PDBias?**

**Synopsis**
Query the photodiode bias voltage set point

**Syntax**
LASer:PDBias?

**Details**
Returns the value of the photodiode bias voltage set point. See LASer:PDBias for a definition of the voltage response value.

**See Also**
LASer:PDBias

---

**LASer:PW?**

**Synopsis**
Query the pulse width

**Syntax**
LASer:PW?

**Details**
Returns the pulse width, in milliseconds. See LASer:PWF and LASer:PWP for more information on setting the pulse width.

**See Also**
LASer:PWF, LASer:PWP

**Support**
Only supported on QCW-equipped controllers.
**LASer:PWF**

**Synopsis**
Set the pulse width while holding the frequency constant

**Syntax**

```
LASer:PWF pulsewidth
```

**Details**
Changes the pulse width when in QCW mode. A new duty cycle value will be computed based on the frequency and pulse width. If the resulting duty cycle is outside the allowable range, an E-201 error will be generated and the command ignored.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pulsewidth</td>
<td>Pulse width, in milliseconds</td>
</tr>
</tbody>
</table>

**See Also**
LASer:PW?, LASer:PWP, LASer:QCWHOLD

**Support**
Only supported on QCW-equipped controllers.

---

**LASer:PWP**

**Synopsis**
Set the pulse width while holding the duty cycle constant

**Syntax**

```
LASer:PWP pulsewidth
```

**Details**
Changes the pulse width when in QCW mode. A new frequency value will be computed based on the duty cycle and pulse width. If the resulting frequency is outside the allowable range, an E-201 error will be generated and the command ignored.

<table>
<thead>
<tr>
<th>Argument</th>

LASer:PW?, LASer:PWF, LASer:QCWHOLD

**Support**
Only supported on QCW-equipped controllers.

---

**LASer:QCWCOUNT**

**Synopsis**
Set the QCW burst count

**Syntax**

```
LASer:QCWCOUNT count
```

**Details**
Sets how many pulses will be generated for each burst when operating in IO (Burst) mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>count</td>
<td>1 – 60,000</td>
<td>Number of pulses per burst</td>
</tr>
</tbody>
</table>

**See Also**
LASer:QCWCOUNT?

**Support**
Only supported on QCW-equipped controllers.

---

**LASer:QCWCOUNT?**

**Synopsis**
Queries the number of pulses generated for each burst when operating in IO (Burst) mode.

**Syntax**

```
LASer:QCWCOUNT?
```
Details
Returns the pulse count. See LASer:QCWCOUNT for a definition of the count response value.

See Also
LASer:QCWCOUNT

Support
Only supported on QCW-equipped controllers.

**LASer:QCWHOLD**

**Synopsis**
Set the QCW (pulse) hold setting for pulse width adjustments in the user interface

**Syntax**
LASer:QCWHOLD hold

**Details**
Sets which value to hold constant (frequency or duty cycle) when making pulse width adjustments in the user interface.

This command has no effect on the LASer:PWF and LASer:PWP commands, as they explicitly define which will be held constant. It only affects the pulse width adjustments done through the front panel.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hold</td>
<td>0</td>
<td>Hold frequency constant</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Hold duty cycle constant</td>
</tr>
</tbody>
</table>

**See Also**
LASer:QCWHOLD?

**Support**
Only supported on QCW-equipped controllers.

**LASer:QCWHOLD?**

**Synopsis**
Queries the QCW (pulse) hold setting for pulse width adjustments in the user interface

**Syntax**
LASer:QCWHOLD?

**Details**
Returns the value of the hold constant. See LASer:QCWHOLD for a definition of the hold response value.

**See Also**
LASer:QCWHOLD

**Support**
Only supported on QCW-equipped controllers.

**LASer:QCWLOW**

**Synopsis**
Set the QCW low pulse current set point

**Syntax**
LASer:QCWLOW setpoint

**Details**
For instruments that support adjustment of the drive current during the low side of QCW pulses, this command adjusts that set point. A setting of zero adjusts it to the lowest possible set point, but is typically not zero (see instrument manual for details).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>setpoint</td>
<td>New QCW low set point, range of zero to current limit</td>
</tr>
</tbody>
</table>

**See Also**
LASer:QCWLOW?
**Support**

Only supported on QCW-equipped controllers that also allow for adjustment of the QCW low set point.

---

**LASer:QCWLOW?**

**Synopsis**

Queries the QCW low set point

**Syntax**

LASer:QCWLOW?

**Details**

Returns the value QCW low set point. See LASer:QCWLOW for a definition of the setpoint response value.

**See Also**

LASer:QCWLOW

**Support**

Only supported on QCW-equipped controllers that also allow for adjustment of the QCW low set point.

---

**LASer:R?**

**Synopsis**

Queries the resistance measurement of the auxiliary temperature sensor

**Syntax**

LASer:R? [sensor index]

**Details**

Returns the measured sensor value. If the optional sensor index argument is omitted, the first sensor is used.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensor index</td>
<td>1 to max</td>
<td>Sensor index</td>
</tr>
</tbody>
</table>

**Response**

<table>

</tbody>
</table>

**See Also**

LASer:T?

**Support**

This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

---

**LASer:RAMP**

**Synopsis**

Sets the ramp rate for output on and set point changes

**Syntax**

LASer:RAMP time

**Details**

For instruments that support control of the output ramp rate, this command allows the user to modify the rate to speed up or slow down set point transitions.

The instrument will ramp up or down the set point over the duration specified by the time parameter.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>0 to 1000</td>
<td>Ramp rate, in milliseconds.</td>
</tr>
</tbody>
</table>

**See Also**

LASer:RAMP?
Support Requires v2.13 or v3.12 or later firmware.

**LASer:RAMP?**

**Synopsis** Queries the laser ramp rate

**Syntax** LASer:RAMP?

**Details** Returns the ramp rate. See LASer:RAMP for a definition of the *time* response value.

**See Also** LASer:RAMP

**Support** Requires v2.13 or v3.12 or later firmware.

**LASer:RANGE**

**Synopsis** Set the output current range

**Syntax** LASer:RANGE range

**Details** For instruments that support dual range operation, this command sets the low or high range.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>range</td>
<td>0</td>
<td>Low range</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>High range</td>
</tr>
</tbody>
</table>

**See Also** LASer:RANGE?

**Support** Not supported on single range instruments.

**LASer:RANGE?**

**Synopsis** Queries the laser current range.

**Syntax** LASer:RANGE?

**Details** Returns the current range. See LASer:RANGE for a definition of the *range* response value.

**See Also** LASer:RANGE

**Support** Not supported on single range instruments.

**LASer:SET:LDI? (I?)**

**Synopsis** Query the laser current set point

**Syntax** LASer:SET:LDI?

**Details** Returns the value of the laser current set point. See LASer:LDI for a definition of the *setpoint* response value.

**See Also** LASer:LDI
**LASer:SET:LDV?**

**Synopsis**
Query the laser voltage set point

**Syntax**
LASer:SET:LDV?

**Details**
Returns the value of the laser voltage set point. See LASer:LDV for a definition of the setpoint response value.

**See Also**
LASer:LDV

---

**LASer:SET:MDI? (IPD?)**

**Synopsis**
Query the photodiode current set point

**Syntax**
LASer:SET:MDI? (IPD?)

**Details**
Returns the value of the photodiode current set point. See LASer:MDI for a definition of the setpoint response value.

**See Also**
LASer:MDI

---

**LASer:SET:MDP? (Ppd?)**

**Synopsis**
Query the photodiode power set point

**Syntax**
LASer:SET:MDP? (Ppd?)

**Details**
Returns the value of the photodiode power set point. See LASer:MDP for a definition of the setpoint response value.

**See Also**
LASer:MDP

---

**LASer:STB?**

**Synopsis**
Query the laser status byte

**Syntax**
LASer:STB?

**Details**
Returns a summary of the enabled conditions within the laser condition and event registers. These bits mirror the bits in the Status Byte Register.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>2</td>
<td>4</td>
<td>Event status register summary</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>8</td>
<td>Condition status register summary</td>
</tr>
</tbody>
</table>

The values are additive, so a return value of 0, 4, 8, or 12 is possible.

**See Also**

---

**LASer:STEP**

**Synopsis**
Set laser step size

**Syntax**
LASer:STEP size

**Details**
The command sets the laser step size used by the LASer:INC or LASer:DEC commands.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>1 to 65000</td>
<td>Step size</td>
</tr>
</tbody>
</table>

A step of 1 equates to 0.01mA, 0.01mW, 1μA, or 0.1mV, depending on the control mode.

**See Also**
LASer:DEC, LASer:INC, LASer:STEP?

---

**LASer:STEP?**

**Synopsis**
Query the laser step size

**Syntax**
LASer:STEP?

**Details**
Returns the value of the laser step size. See LASer:STEP for a definition of the size response value.

**See Also**
LASer:STEP

---

**LASer:T?**

**Synopsis**
Queries the converted temperature measurement of the auxiliary temperature sensor

**Syntax**
LASer:T? [sensor index]

**Details**
Returns the actual (measured) sensor temperature. If the optional sensor index argument is omitted, the first sensor is used. The conversion from resistance to temperature is done using the Steinhart-Hart formula and the constants set by the LASer:CONST command.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensor index</td>
<td>1 to max</td>
<td>Sensor index</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temperature</td>
<td>Actual sensor temperature, in degrees Celsius</td>
</tr>
</tbody>
</table>

**Syntax**
LASer:T?, LASer:R?, LASer:CONST?

**Support**
This function is only supported for controllers with auxiliary temperature inputs. See your controller’s manual for more information.

---

**LASer:TOLerance**

**Synopsis**
Set the laser tolerance criteria

**Syntax**
LASer:TOLerance tolerance, time

**Details**
The LASer:TOLerance command allows control over when the output of the laser driver is considered in tolerance (or stable), in order to satisfy the tolerance condition of the operation complete definition. When used in conjunction with the *WAI command, it can control when the next command is processed, delaying processing until the output stabilizes at its set point.
<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tolerance</td>
<td>0 to 100</td>
<td>Current tolerance, in milliamps</td>
</tr>
<tr>
<td>time</td>
<td>0.1 to 50</td>
<td>Time window in seconds</td>
</tr>
</tbody>
</table>

To be considered in tolerance, the measured current must be within the set point plus or minus the `tolerance` value (the tolerance window) for `time` seconds. Any time it leaves the tolerance window, the timer will reset to zero and begin counting the next time it enters the tolerance window.

In photodiode current mode, the `tolerance` is fixed at 50μA. In photodiode power mode, `tolerance` is fixed at 50mW. In voltage control mode, `tolerance` is fixed at 50mV.

**See Also**

LASer:TOLERance?

---

**LASer:TOLERance?**

**Synopsis**
Query the laser tolerance criteria

**Syntax**

```
LASer:TOLERance?
```

**Details**

Returns the value of the laser tolerance criteria. See LASer:TOLERance for a definition of the `tolerance` and `time` response values.

**See Also**

LASer:TOLERance

---

**LASer:TRIGger**

**Synopsis**
Generates a single trigger

**Syntax**

```
LASer:TRIGger
```

**Details**

The LASer:TRIGger command is used to generate a trigger into the QCW system, and acts exactly like a single rising edge on the Trigger Input BNC. See the manual section on QCW operation for more information on triggering.

**Support**

Only supported on QCW-equipped controllers.

---

**LASer:USERCAL:EDIT**

**Synopsis**
Enable or disabled user calibration editing

**Syntax**

```
LASer:USERCAL:EDIT enable
```

**Details**

Sets the edit enable state for user calibration. A LASer:USERCAL:PUT command will fail until the editing is enabled with this command. The edit state will automatically be set to false after a *RST command or power cycle.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>User calibration editing disabled</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>User calibration editing enabled</td>
</tr>
</tbody>
</table>

This is a global command: enabling/disabling user calibration editing for one channel will enable/disable for all channels in the system.

**See Also**

LASer:USERCAL:EDIT?, LASer:USERCAL:PUT
**LASer:USERCAL:EDIT?**

**Synopsis**  
Query the state of the user calibration edit enable flag

**Syntax**  
LASer:USERCAL:EDIT?

**Details**  
Returns 0 if user calibration editing is disabled, and 1 if user calibration editing is enabled.

**See Also**  
LASer:USERCAL:EDIT

**Support**  
This function is only available in firmware version 2.0 and later.

---

**LASer:USERCAL:GET?**

**Synopsis**  
Query a laser USERCAL setting

**Syntax**  
LASer:USERCAL:GET? index

**Details**  
Returns the slope and offset compensation values for a specific user calibration index. See LASer:USERCAL:PUT for a definition of the index argument and slope and offset response values.

**See Also**  
LASer:USERCAL:PUT

**Support**  
This function is only available in firmware version 2.0 and later.

---

**LASer:USERCAL:GETALL?**

**Synopsis**  
Query all laser USERCAL settings

**Syntax**  
LASer:USERCAL:GETALL? addterm

**Details**  
Returns the slope and offset compensation values for all user calibration indexes. If addterm is non-zero, command terminator (CR, LF, or CR/LF) will be sent after each index. See LASer:USERCAL:PUT for a definition of the index argument and slope and offset response values.

**See Also**  
LASer:USERCAL:PUT

**Support**  
This function is only available in firmware version 2.0 and later.

---

**LASer:USERCAL:PUT**

**Synopsis**  
Sets a USERCAL value

**Syntax**  
LASer:USERCAL:PUT index, slope, offset

**Details**  
The command sets the user calibration setting for a specific index, allowing for user compensation of measurements or set points. The default value for all slopes is 1, and the default value for all offsets is 0.

Compensation is applied according to the following formula:
\[ \text{compensated} = \text{slope} \times \text{uncompensated} + \text{offset} \]

\text{LASer:USERCAL:PUT} is only supported on certain instruments. Not all indexes are supported in every instrument. See your user’s manual for details on what measurements are supported.

You must enable editing of user calibration values with the \text{LASer:USERCAL:EDIT} command.

\textbf{See Also} \quad \text{LASer:USERCAL:EDIT, LASer:USERCAL:GET?}

\textbf{Support} \quad \text{This function is only available in firmware version 2.0 and later.}

\textbf{LASer:USERCAL:RESET}

\textbf{Synopsis} \quad \text{Resets all laser user calibration settings to factory defaults}

\textbf{Syntax} \quad \text{LASer:USERCAL:RESET}

\textbf{Details} \quad \text{Resets all laser user calibration slopes to 1 and all offsets to 0.}

\textbf{See Also} \quad \text{LASer:USERCAL:EDIT}

\textbf{Support} \quad \text{This function is only available in firmware version 2.0 and later.}

\textbf{LASer:VSENSE}

\textbf{Synopsis} \quad \text{Select local or remote voltage sense}
**Syntax**

LASer:VSENSE select

**Details**
For instruments that support selectable local/remote voltage sense, this command selects local or remote sense.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>select</td>
<td>0</td>
<td>Local voltage sense</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Remote voltage sense</td>
</tr>
</tbody>
</table>

**See Also**
LASer:VSENSE?

**Support**
Only supported on instrument equipped with 4-wire voltage sense capability. See your controller’s manual for more details.

---

**LASer:VSENSE?**

**Synopsis**
Queries the voltage sense selection.

**Syntax**
LASer:VSENSE?

**Details**
For instruments that support selectable local/remote voltage sense, this command returns the select value. See the LASer:VSENSE command for more information.

**See Also**
LASer:VSENSE

**Support**
Only supported on instrument equipped with 4-wire voltage sense capability. See your controller’s manual for more details.

---

**LASer:VSENSEWARN**

**Synopsis**
Enables or disables the external voltage sense warning

**Syntax**
LASer:VSENSEWARN enable

**Details**
On some instruments that support selectable local/remote voltage sense, the controller can additionally monitor the difference between the local and remote voltage measurement to detect major measurement discrepancies (such as if the remote sense lines were not connected). When operating in remote sense mode, the controller will generate a warning (W-800) if a large measurement error is detected. This command can disable that warning.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Warning disabled</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Warning enabled</td>
</tr>
</tbody>
</table>

**See Also**
LASer:VSENSE, LASer:VSENSEWARN?

**Support**
Not supported on all instruments, check specific instrument’s user’s manual for more information.

---

**LASer:VSENSEWARN?**

**Synopsis**
Queries the external voltage sense warning setting

**Syntax**
LASer:VSENSEWARN?
Details

For instruments that support selectable local/remote voltage sense and voltage sense warning, this command returns the warning state.

See Also

LASer:VSENSEWARN

Support

Not supported on all instruments, check specific instrument’s user’s manual for more information.

LOCAL

Synopsis

Returns instrument to local mode

Syntax

LOCAL

Details

After issuing the LOCAL command, the remote light will go out, and front panel controls will be enabled.

MESsage

Synopsis

Set the message buffer

Syntax

MESsage string

Details

Sets the internal message buffer to the value of string, up to a maximum of 16 characters.

See Also

MESsage?

MESsage?

Synopsis

Query the message buffer

Syntax

MESsage?

Details

Returns the value of the message buffer.

See Also

MESsage

ONDELAY

Synopsis

Set the laser output on delay

Syntax

ONDELAY time

Details

The ONDELAY command controls how long the laser driver will delay between the time the user or command turns on the laser on LED and when the output is actually turned on.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>time</td>
<td>0 to 30000</td>
<td>On delay, in milliseconds</td>
</tr>
</tbody>
</table>

Setting the ONDELAY value to 0 disables the delay feature.

See Also

ONDELAY?
**ONDELAY?**

**Synopsis**  
Query the laser output on delay

**Syntax**  
`ONDELAY?`

**Details**  
Returns the value of the laser output on delay. See the `ONDELAY` command for a complete definition of possible return values.

**See Also**  
`ONDELAY`

---

**RADix**

**Synopsis**  
Set the radix (number base)

**Syntax**  
`RADix base`

**Details**  
By default, the instrument is set to decimal number base. Changing to an alternate number base will cause queries for integer values to be returned in the specified number base.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>base</code></td>
<td>BIN</td>
<td>Binary format (base 2)</td>
</tr>
<tr>
<td></td>
<td>OCT</td>
<td>Octal format (base 8)</td>
</tr>
<tr>
<td></td>
<td>DEC</td>
<td>Decimal format (base 10)</td>
</tr>
<tr>
<td></td>
<td>HEX</td>
<td>Hexadecimal format (base 16)</td>
</tr>
</tbody>
</table>

See the section *Working with Radixes and Hex Floats* for more information on using this command.

**See Also**  
`RADix`  
`RADix?`

---

**RADix?**

**Synopsis**  
Query the radix (number base)

**Syntax**  
`RADix?`

**Details**  
Returns the current number base. See the `RADix` command for a complete definition of possible return values.

**See Also**  
`RADix`

---

**REMERR**

**Synopsis**  
Set display of errors while in remote mode

**Syntax**  
`REMERR enable`

**Details**  
This command controls if the instrument will display errors while in remote mode. If set to zero, then errors will not be displayed. If set to one, errors will be displayed. Errors will always accumulate in the error queue.

Instruments without a display are a special case: a `REMERR 0` will disable the error LED from being lit on error at any time, regardless if the instrument has been sent a
command (and therefore placed in remote mode) or not. However, the error LED can still be turned on with the ERRORLED command when ERRORLEDMODE is 1.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Do not display errors or turn on error LED in remote mode</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Display errors in remote mode</td>
</tr>
</tbody>
</table>

See Also REMERR?, ERRORLED, ERRORLEDMODE, ERR?, ERRSTR?

REMERR?

Synopsis Query the display of errors while in remote mode

Syntax REMERR?

Details Returns the current REMERR setting. See the REMERR command for a complete definition of possible return values.

See Also REMERR

REMSET

Synopsis Enables the changing of the set point and on/off control from the front panel while in remote mode

Syntax REMSET enable

Details This command enables the changing of the set point and on/off control from the front panel while in remote mode. By default, when in remote mode, the set point cannot be changed and output cannot be turned on or off, as most programs do not react well to the set point or on/off state being changed asynchronously from the program operation. However, it can be quite useful to be able to continue to adjust the instrument even when it is under remote control, and this command enables or disabled this capability.

Alternatively, if your program no longer needs to remotely control the instrument, you can use the LOCAL command to return the instrument to local control.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Prevent set point and on/off change while in remote mode</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enable set point and on/off change while in remote mode</td>
</tr>
</tbody>
</table>

See Also REMSET?, LOCAL

REMSET?

Synopsis Query the state of the remote set mode

Syntax REMSET?

Details Returns the current REMSET setting. See the REMSET command for more information.

See Also REMSET

SCRIPT:GET?

Synopsis Retrieve a script
Syntax  |  SCRIPT:GET? index
---|---
Details  |  Returns the script stored in position index. See the Using Scripts section above for more information.
See Also  |  SCRIPT:PUT
Support  |  This function is only available in firmware version 2.0 and later.

**SCRIPT:GO**

Synopsis  |  Remotely executes a script
Syntax  |  SCRIPT:GO index
Details  |  Executes the script stored at position index. See the Using Scripts section above for more information.
See Also  |  SCRIPT:PUT
Support  |  This function is only available in firmware version 2.0 and later.

**SCRIPT:PUT**

Synopsis  |  Set a script
Syntax  |  SCRIPT:PUT index, script
Details  |  Stores a script for execution by a function key, or with the SCRIPT:GO command. See the Using Scripts section above for more information.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>index</td>
<td>Script index, 1 to 4</td>
</tr>
<tr>
<td>script</td>
<td>Script, maximum 200 characters.</td>
</tr>
</tbody>
</table>

See Also  |  SCRIPT:GET?, SCRIPT:GO
Support  |  This function is only available in firmware version 2.0 and later.

**SN?**

Synopsis  |  Query the serial number of the instrument
Syntax  |  SN?
Details  |  Returns the serial number of the instrument. This is the same information that is part of the *IDN? query.
See Also  |  *IDN?

**TEC:ACTIVESENsor**

Synopsis  |  Selects the active sensor
Syntax  |  TEC:ACTIVESENsor sensor index
Details  For controllers that support multiple primary sensors, this command selects which primary sensor will be used for feedback in the temperature control loop. The primary sensor type must be set to a sensor type other than disabled prior to selecting it.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>sensor index</td>
<td>Sensor index of the primary sensor to use for the control loop.</td>
</tr>
</tbody>
</table>

Only primary sensors can be selected. Only supported on instruments that feature multiple primary sensors.

See Also  TEC:AUTOTUNE?

---

**TEC:ACTIVESENsor?**

**Synopsis**  Query the active sensor

**Syntax**  TEC:ACTIVESENsor?

**Details**  Returns the active sensor. See the TEC:ACTIVESENsor for a definition of the sensor index reply.

See Also  TEC:ACTIVESENsor

---

**TEC:ANALOG:MODE**

**Synopsis**  Enable or disable the analog set point mode

**Syntax**  TEC:ANALOG:MODE enable

**Details**  Enables or disables the analog set point mode.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>1 to enable, 0 to disable</td>
</tr>
</tbody>
</table>

See the instrument’s user’s manual for more information on the use of the analog interface. Only supported on instruments that feature an analog input function.

See Also  TEC:AUTOTUNE?

---

**TEC:ANALOG:MODE?**

**Synopsis**  Query the analog set point mode

**Syntax**  TEC:ANALOG:MODE?

**Details**  Returns the enable state of the analog set point mode.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>1 if enabled, 0 if disabled</td>
</tr>
</tbody>
</table>

See the instrument’s user’s manual for more information on the use of the analog interface. Only supported on instruments that feature an analog input function.

See Also  TEC:ANALOG:MODE
**TEC:ANALOG:OUT**

**Synopsis**: Sets analog output function

**Syntax**: TEC:ANALOG:OUT function [, parameter]

**Details**: Sets the analog output function that controls the voltage of the analog output. The parameter argument is only used on functions 1, 2, and 3.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

TEC:ANALOG:TLOW?

**Details**  
Returns the T\text{ANALOG-LOW} used in the calculation of the analog temperature set point.

See the instrument's user's manual for more information on the use of the analog interface. Only supported on instruments that feature an analog input function.

See Also  
TEC:ANALOG:TLOW

**TEC:AUTOON**

**Synopsis**  
Disables or enables the automatic output on at controller power up

**Syntax**  
TEC:AUTOON mode [, delay, [temp]]

**Details**  
The TEC:AUTOON command is used to automatically turn the TEC on when the controller is powered up, and optionally override the set point to a specific starting temperature.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mode</td>
<td>0</td>
<td>Disables automatic on</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables automatic on, uses last temperature set point</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Enables automatic on, override set point</td>
</tr>
</tbody>
</table>

| delay     | 0 to 3600 | Delay, in seconds, before output is turned on |
| temp      | within limits | Temperature set point override (mode 2 only) |

If the TEC output is commanded on or off before the delay expires (via a button on the front panel, a signal from the control interface, or a TEC:OUT command), it will cancel any pending automatic turn on.

See Also  
TEC:AUTOON?

**TEC:AUTOON?**

**Synopsis**  
Query the automatic turn-on settings

**Syntax**  
TEC:AUTOON?

**Details**  
Returns the mode, delay, and set point used for the automatic turn-on. All parameters are returned, regardless of the mode. See TEC:AUTOON for a description of these parameters.

See Also  
TEC:AUTOON
**TEC:AUTOTUNE**

**Synopsis**
Start the AutoTune process

**Syntax**
TEC:AUTOTUNE temperature

**Details**
The TEC:AUTOTUNE command is used to start the AutoTune process, using the temperature parameter as the AutoTune point. The current and temperature limits should be properly setup prior to starting AutoTune.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temperature</td>

**TEC:CABLER**

**Summary**
Set the cable resistance

**Syntax**
TEC:CABLER resistance

**Details**
The TEC:CABLER command can be used to set the cable resistance, which is then used to remove voltage drops from the TEC voltage measurement.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resistance</td>
<td>Resistance of the cable, in ohms.</td>
</tr>
</tbody>
</table>

See the user’s manual for additional information on using this setting.

**See Also**

---

**TEC:CABLER?**

**Summary**
Query the cable resistance value

**Syntax**
TEC:CABLER?

**Details**
Returns the value of the cable resistance value. See TEC:CABLER for a definition of the response value.

**See Also**
TEC:CABLER

---

**TEC:CABLETYPE?**

**Summary**
Returns the cable type (high or low current)

**Syntax**
TEC:CABLETYPE?

**Details**
For instruments that support a cable type identification (such as the 5300 TECSource), this command returns the current rating for the cable plugged into the instrument. If the instrument does not support cable type identification, a “0” is returned for instruments rated for 5A or less (such as 5240 TECSource), otherwise a “2” is returned.

<table>

---

**TEC:CONST**

**Synopsis**
Set sensor temperature conversion constants for the active sensor

**Syntax**
```
TEC:CONST A, B [, C [, R0]]
```

**Details**
The TEC:CONST command sets the sensor constants for conversion of the sensor value to temperature for the active sensor. The number of parameters are dependent on the sensor type.

For the thermistor sensors, A, B, and C are used as constants for the Steinhart-Hart equation for conversion of resistance to temperature. By default, the thermistor constants are set to those for a BetaTHERM 10K3A1 thermistor.

For LM335 and AD590 sensors, A is used as a slope correction (M) term and B is an offset (B) term. By default, A is set to one and B is set to zero.
For RTD sensors, A, B, C, and R0 are used as constants for the RTD to temperature equation. By default, the RTD constants are set to the standard Laboratory values.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Thermistors:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A</td>
<td>± 9.9999</td>
<td>First Steinhart-Hart constant (x 10^-3)</td>
</tr>
<tr>
<td>B</td>
<td>± 9.9999</td>
<td>Second Steinhart-Hart constant (x 10^-4)</td>
</tr>
<tr>
<td>C</td>
<td>± 9.9999</td>
<td>Third Steinhart-Hart constant (x 10^-7)</td>
</tr>
<tr>
<td>For LM335:</td>
<td></td>
<td></td>
</tr>
<tr>

<tr>
<td>B</td>
<td>± 99.9999</td>
<td>Offset term, in °C</td>
</tr>
<tr>
<td>For RTD:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>A</td>
<td>± 9.9999</td>
<td>First RTD constant (x 10^-3)</td>
</tr>
<tr>
<td>B</td>
<td>± 9.9999</td>
<td>Second RTD constant (x 10^-6)</td>
</tr>
<tr>
<td>C</td>
<td>± 9.9999</td>
<td>Third RTD constant (x 10^-12)</td>
</tr>
<tr>
<td>R0</td>
<td>10 to 2000</td>
<td>Nominal resistance at 0°C (Ω)</td>
</tr>
</tbody>
</table>

Some vendors may refer to A, B, and C as C1, C2, & C3.

For additional information, see the sensor sections in the user’s manual.

See Also
- TEC:CONST?

### TEC:CONST?
**Synopsis**
Query sensor temperature conversion constants for the active sensor  

**Syntax**
TEC:CONST?

**Details**
Returns the sensor temperature conversion constants. See the TEC:CONST command for a complete definition of the A, B, C, and R0 response values.

See Also  
TEC:CONST

### TEC:CONSTIDX
**Synopsis**
Set sensor temperature conversion constants for a specific sensor class and type  

**Syntax**
TEC:CONSTIDX sensor class, sensor type, A, B [, C [, R0]]

**Details**
The TEC:CONSTIDX command works identically to the TEC:CONST command, except that the sensor class and sensor type is explicitly set by the command arguments. The number of additional parameters is dependent on the sensor type.

See TEC:CONST for details on the sensor parameters (A, B, C, and R0). **Sensor class and sensor type are defined below:**
Argument | Value | Description
--- | --- | ---
sensor class | 1 | Primary
 | 2 | Auxiliary
sensor type | 0 | Disabled
 | 1 | 100μA Thermistor
 | 2 | 10μA Thermistor
 | 3 | LM335
 | 4 | AD590
 | 5 | 100Ω RTD
 | 6 | 100Ω RTD (4-wire sense)
 | 8 | 1kΩ RTD
 | 9 | 1kΩ RTD (4-wire sense)

See Also: TEC:CONST, TEC:CONSTIDX?

**TEC:CONSTIDX?**

**Synopsis**: Query sensor temperature conversion constants for a specific sensor index and type

**Syntax**: `TEC:CONSTIDX? sensor class, sensor type`

**Details**: Complementary function to TEC:CONSTIDX, and returns the sensor temperature conversion constants for a specific sensor class and sensor type. See the TEC:CONSTIDX command for a complete definition of the sensor class and sensor type arguments.

See Also: TEC:CONSTIDX

**TEC:DEC**

**Synopsis**: Decrement the TEC set point

**Syntax**: `TEC:DEC steps`

**Details**: The TEC:DEC command uses the step size defined with the TEC:STEP command to decrement the TEC set point. The set point is decremented steps times the step size.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>steps</td>
<td>1 to 65000</td>
<td>Number of steps to decrement</td>
</tr>
</tbody>
</table>

See Also: TEC:INC, TEC:STEP

**TEC:DIO:IN?**

**Synopsis**: Query the state of a digital input

**Syntax**: `TEC:DIO:IN? port`

**Details**: Returns the state of a specific digital input port.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Interlock</td>
</tr>
<tr>
<td>1 to max</td>
<td>Digital input pin</td>
<td></td>
</tr>
</tbody>
</table>

The return value will be zero if the input is low (or interlock is shorted), 1 if the input is high (or the interlock is open). An unconnected digital input may be high or low,
depending on the electrical configuration of the port. See the user’s manual for more details.

Only supported on instruments that feature digital input capability.

**See Also**

TEC:DIO:INMODE

---

### TEC:DIO:INMODE

**Synopsis**
Set the digital input mode

**Syntax**

```
TEC:DIO:INMODE port, function [,invert]
```

**Details**
Selects the function and invert setting for a specific input port. Input ports can be used as additional interlocks (function 1), or to remotely control the on/off state of the instrument (function 2). The invert setting is used to control if the function is active when the pin is high (invert 0) or when the pin is low (invert 1).

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Interlock input</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital input pin</td>
</tr>
<tr>
<td>function</td>
<td>0</td>
<td>Monitor only (no function)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Interlock</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>Output On</td>
</tr>
<tr>
<td>invert</td>
<td>0</td>
<td>No logic inversion (function is active high)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Inverted logic (function is active low)</td>
</tr>
</tbody>
</table>

Only supported on instruments that feature digital input capability.

**See Also**

TEC:DIO:IN?

---

### TEC:DIO:INMODE?

**Synopsis**
Query the digital input mode

**Syntax**

```
TEC:DIO:INMODE? port
```

**Details**
Returns the input mode and invert setting for a specific input port. See TEC:DIO:INMODE for a definition of the port argument and function and invert response values.

Only supported on instruments that feature digital input capability.

**See Also**

TEC:DIO:INMODE

---

### TEC:DIO:OUT?

**Synopsis**
Query the state of a digital output

**Syntax**

```
TEC:DIO:OUT? port
```

**Details**
Returns the state of a specific digital output port.
The return value will be zero if in the output is low (or the relay is open), 1 if the output is high (or the relay is closed).

Only supported on instruments that feature digital output capability.

See Also TEC:DIO:OUTMODE

**TEC:DIO:OUTMODE**

**Synopsis** Set the digital input mode

**Syntax** TEC:DIO:OUTMODE port, function [,invert]

**Details** Selects the function and invert setting for a specific output port. Output ports can be used to signal various instrument states or directly controlled. The invert setting is used to control if the pin is set to high function is active (invert 0) or low (invert 1). The relay only supports an invert setting of zero.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>port</td>
<td>0</td>
<td>Relay</td>
</tr>
<tr>
<td></td>
<td>1 to max</td>
<td>Digital output pin</td>

<td>Temperature limit</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>Current limit</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>Remote mode</td>
</tr>
<tr>
<td></td>
<td>7</td>
<td>Voltage limit</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>invert</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>0</td>
<td>No logic inversion (pin is high if function is active)</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Inverted logic (pin is low if function is active)</td>
</tr>
</tbody>
</table>

The invert setting is ignored when the function is 0 or 1.

Only supported on instruments that feature digital output capability.

See Also TEC:DIO:OUTMODE?, TEC:DIO:OUT

**TEC:DIO:OUTMODE?**

**Synopsis** Query the digital output mode

**Syntax** TEC:DIO:OUTMODE? port

**Details** Returns the output mode and invert setting for a specific output port. See TEC:DIO:OUTMODE for a definition of the port argument and function and invert response values.

Only supported on instruments that feature digital output capability.

See Also TEC:DIO:OUTMODE
**TEC:DISPLAY**

**Synopsis**
Set the display enable state

**Syntax**
TEC:DISPLAY enable

**Details**
The TEC:DISPLAY command can be used to completely lock out local operation of the instrument and display “Display Disabled” instead of the normal display.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disables the display and front panel</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables the display and front panel</td>
</tr>
</tbody>
</table>

Once the display is disabled, the front panel is completely locked out. The only way to restore functionality to the front panel is to issue a “TEC:DISPLAY 1” or cycle power on the unit.

**See Also**
TEC:DISPLAY?

**TEC:DISPLAY?**

**Synopsis**
Query the display enable state

**Syntax**
TEC:DISPLAY?

**Details**
Returns the value of the TEC display enable state. See TEC:DISPLAY for a definition of the enable response value.

**See Also**
TEC:DISPLAY

**TEC:ENABLE:AUXLIMITS**

**Synopsis**
Enable or disable the use of auxiliary temperature limits

**Syntax**
TEC:ENABLE:AUXLIMITS enable

**Details**
When enabled, the auxiliary temperature sensor limits become active, and if the measurement exceeds its high or low limit, a corresponding temperature high or low limit condition will be generated. Depending on the setting in the Output Off Enable register, this can then shut down the output.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disable auxiliary temperature sensor limits</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>Enables auxiliary temperature sensor limits</td>
</tr>
</tbody>
</table>

**See Also**

**TEC:ENABLE:AUXLIMITS?**

**Synopsis**
Query the state of the auxiliary temperature limit enable

**Syntax**
TEC:ENABLE:AUXLIMITS?

**Details**
Returns the state of auxiliary temperature limit enable. See the TEC:ENABLE:AUXLIMITS command for a definition of enable response.
See Also TEC:ENABLE:AUXLIMITS

**TEC:ENABLE:COND**

**Synopsis**
Set TEC Condition Enable register

**Syntax**
TEC:ENABLE:COND *conditions*

**Details**
Enables reporting of selected conditions to the Status Byte Register. See the TEC:COND command for a definition of the *conditions* parameter. The default value for this register is 0.

**See Also**
TEC:ENABLE:COND?, TEC:COND?

**TEC:ENABLE:COND?**

**Synopsis**
Query TEC Condition Enable register

**Syntax**
TEC:ENABLE:COND?

**Details**
Returns the value of the TEC Condition Enable register. See the TEC:COND command for a definition of the *conditions* response.

**See Also**
TEC:ENABLE:COND, TEC:COND?

**TEC:ENABLE:EVEnt**

**Synopsis**
Set TEC Event Enable register

**Syntax**
TEC:ENABLE:EVEnt *events*

**Details**
Enables reporting of selected events to the Status Byte Register. See the TEC:EVEnt command for a definition of the *events* parameter. The default value for this register is 0.

**See Also**
see also TEC:ENABLE:EVEnt?, TEC:EVE?

**TEC:ENABLE:EVEnt?**

**Synopsis**
Query TEC Event Enable register

**Syntax**
TEC:ENABLE:EVEnt?

**Details**
Returns the value of the TEC Event Enable register. See the TEC:EVEnt command for a definition of the *events* response.

**See Also**
TEC:ENABLE:EVEnt, TEC:EVE?

**TEC:ENABLE:NONACTIVELIMITS**

**Synopsis**
Enable or disable the use of temperature limits for non-active primary sensors

**Syntax**
TEC:ENABLE:NONACTIVELIMITS *enable*

**Details**
When enabled, the temperature sensor limits for non-active primary sensors become active, and if the measurement exceeds its high or low limit, a corresponding
temperature high or low limit condition will be generated. Depending on the setting in the Output Off Enable register, this can then shut down the output.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Disable non-active primary temperature sensor limits</td>

<tr>
<td>delay</td>
<td>1 to 240</td>
<td>Minutes to delay turning fan off (only applies</td>
</tr>
<tr>
<td></td>
<td></td>
<td>to ‘Delayed off’ mode).</td>
</tr>
</tbody>
</table>

The values SLOW, MEDIUM, and FAST correspond to 9V, 10.5V, and 12V, respectively. The fan speed can also be controlled by selecting a specific voltage to drive the fan. When using external fan control, ensure your fan and voltage setting are properly match, or damage to the fan may occur.

Setting the mode to 1 will turn the fan off whenever the output is off. Setting the mode to 2 will turn the fan on always, regardless of the TEC output state. Setting the mode to 3 will delay the turning off of the fan to delay minutes after the TEC output is turned off.

The delay setting only applies when mode is set to 3 (delayed off), and sets the number of minutes to delay the fan from turning off after the output has been turned off.

The 5230 does not support the FAN setting.

**TEC:PID**

**Synopsis**
Sets the PID parameters

**Syntax**
TEC:PID *p*, *i*, *d*

**Details**
Sets PID parameters of the control loop when the GAIN is set to PID.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>p</em></td>
<td>The Proportional term, can be from 0 to 1000</td>
</tr>
<tr>
<td><em>i</em></td>
<td>The Integral term, can be from 0 to 1000</td>
</tr>
<tr>
<td><em>d</em></td>
<td>The Derivative term, can be from 0 to 1000</td>
</tr>
</tbody>
</table>

The *i* and *d* values can be omitted, such that value commands might be:

- TEC:PID 1
- TEC:PID 1,2
- TEC:PID 1,2,3
But the following is not valid:
TEC:PID 1,,3

**TEC:SENsor**

**Synopsis**
Set the sensor type

**Syntax**
TEC:SENsor sensor type [ , sensor index]

**Details**
Sets the sensor type. Note that a sensor type of 0 (disabled) can only be selected on non-active sensors. If the optional sensor index argument is omitted, the active sensor is used.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sensor type</td>
<td>0</td>
<td>Disabled</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>100uA Thermistor</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>10uA Thermistor</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>LM335</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>AD590</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>100Ω RTD</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>100Ω RTD (4-wire sense)</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>1kΩ RTD</td>
</tr>
<tr>
<td>sensor index</td>
<td>9</td>
<td>1kΩ RTD (4-wire sense)</td>
</tr>
</tbody>
</table>

The sensor index value is only valid on instruments with multiple sensor inputs, such as the 5400.

Check with the controller user’s manual to determine which sensors are supported.

TEC:T

---

**TEC:STB?**

**Synopsis**

Query the TEC status byte

**Syntax**

TEC:STB?

**Details**

Returns a summary of the enabled conditions within the TEC condition and event registers. These bits mirror the bits in the Status Byte Register.

<table>
<thead>
<tr>
<th>Response</th>
<th>Bit</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>0</td>
<td>1</td>
<td>Event status register summary</td>
</tr>
<tr>
<td></td>
<td>1</td>
<td>2</td>
<td>Condition status register summary</td>
</tr>
</tbody>
</table>

The values are additive, so a return value of 0, 1, 2, or 3 is possible.

**See Also**

---

**TEC:STEP**

**Synopsis**

Set TEC step size

**Syntax**

TEC:STEP size

**Details**

The command sets the TEC step size used by the TEC:DEC or TEC:INC commands.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>size</td>
<td>1 to 65000</td>
<td>Step size</td>
</tr>
</tbody>
</table>

The size value corresponds to the resolution of the set point, regardless of control mode or sensor. For example, if the temperature resolution is 0.01°C, then a step of 1 would mean a change of 0.01°C. Likewise, for example, RTDs, which typically have a display resolution of 0.01Ω, a step of one would mean a change of 0.01Ω.

**See Also**

<td>Actual sensor temperature, in degrees Celsius</td>
</tr>
</tbody>
</table>

**See Also**  
TEC:T

---

**TEC:TOLerance**

**Synopsis**  
Set the TEC tolerance criteria

**Syntax**  
TEC:TOLerance tolerance, time

**Details**  
The TEC:TOLerance command allows control over when the output of the temperature controller is considered in tolerance (or stable), in order to satisfy the tolerance condition of the operation complete definition. When used in conjunction with the *WAI command, it can control when the next command is processed, delaying processing until the output stabilizes at its set point.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tolerance</td>
<td>0.01 to 10</td>
<td>Tolerance, in °C</td>
</tr>
<tr>
<td>time</td>
<td>0.1 to 50</td>
<td>Time window in seconds</td>
</tr>
</tbody>
</table>

To be considered in tolerance, the measured temperature must be within the set point plus or minus the tolerance value (the tolerance window) for time seconds. Any time it leaves the tolerance window, the timer will reset to zero and begin counting the next time it enters the tolerance window.
In sensor control mode, the tolerance is fixed at 0.01kΩ (100µA thermistor), 0.1kΩ (10µA thermistor), 0.1µA (AD590), 1mV (LM335), and 0.1Ω (RTD).

See Also  TEC:TOLerance?

TEC:TOLerance?
Synopsis Query the TEC tolerance criteria
Syntax TEC:TOLerance?
Details Returns the value of the TEC tolerance criteria. See TEC:TOLerance for a definition of the tolerance and time response values.
See Also  TEC:TOLerance

TEC:TRATE
Synopsis Set the target temperature slew rate
Syntax TEC:TRATE rate
Details Sets the desired temperature slew rate. Set to 0 to disable, or to a maximum of 100°C/minute.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rate</td>
<td>Temperature slew rate, in degrees Celsius per minute</td>
</tr>
</tbody>
</table>

Not supported on all instruments.

See Also  TEC:SET:T?

TEC:TRATE?
Synopsis Query the target temperature slew rate set point
Syntax TEC:TRATE?
Details Returns the slew rate as set by the TEC:TRATE command.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rate</td>
<td>Temperature slew rate, in degrees Celsius per minute</td>
</tr>
</tbody>
</table>

Not supported on all instruments.

See Also  TEC:T

TEC:TSTEP
Synopsis Set the temperature set point step size
Syntax TEC:TSTEP step size
Details

Sets the desired temperature step size. Does not affect temperature set points sent via the TEC:T command, only the size of the change for each tick of the adjustment knob on the front panel.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>step size</td>
<td>1</td>
<td>0.001°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>2</td>
<td>0.005°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>3</td>
<td>0.01°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>0.05°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>5</td>
<td>0.1°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>6</td>
<td>0.5°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>7</td>
<td>1°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>8</td>
<td>5°C per knob tick</td>
</tr>
<tr>
<td></td>
<td>9</td>
<td>10°C per knob tick</td>
</tr>
</tbody>
</table>

Step size cannot be set below the measurement resolution of the instrument. For example, if the temperature measurement resolution is 0.01°C, the smallest allowable step size is 0.01. For instrument that do not allow front panel adjustments, this command has no effect.

Support

This function is only available in firmware version 1.30 and later.
TEC:USERCAL:EDIT?

Synopsis  Query the state of the user calibration edit enable flag

Syntax    TEC:USERCAL:EDIT?

Details   Returns 0 if user calibration editing is disabled, and 1 if user calibration editing is enabled.

See Also  TEC:USERCAL:EDIT

Support   This function is only available in firmware version 1.30 and later.

TEC:USERCAL:GET?

Synopsis  Query a TEC USERCAL setting

Syntax    TEC:USERCAL:GET? index [, sensor index]

Details   Returns the slope and offset compensation values for a specific user calibration index. See TEC:USERCAL:PUT for a definition of the index and sensor index arguments and slope and offset response values.

See Also  TEC:USERCAL:PUT

Support   This function is only available in firmware version 1.30 and later. Only limited indexes are available in pre-2.0 firmware (indexes 4, 5, 9, and 10). For version 1.xx firmware, see the controller’s manual for details on for the calibration data is managed.

TEC:USERCAL:GETALL?

Synopsis  Query all TEC USERCAL settings

Syntax    TEC:USERCAL:GETALL? add terminator

Details   Returns the slope and offset compensation values for all user calibration indexes. If add terminator is non-zero, command terminator (CR, LF, or CR/LF) will be sent after each index. See LASer:USERCAL:PUT for a definition of the index argument and slope and offset response values.

See Also  TEC:USERCAL:PUT

Support   This function is only available in firmware version 1.30 and later.

TEC:USERCAL:PUT

Synopsis  Sets a USERCAL value

Syntax    TEC:USERCAL:PUT index, slope, offset [, sensor index]

Details   The command sets the user calibration setting for a specific index, allowing for user compensation of measurements or set points. The default value for all slopes is 1, and the default value for all offsets is 0.

Compensation is applied according to the following formula:
\[\text{compensated} = \text{slope} \times \text{uncompensated} + \text{offset}\]

</tbody>
</table>

TEC:USERCAL:PUT is only supported on certain instruments. Not all indexes are supported in every instrument. See your user’s manual for details on what measurements are supported.

Version 1.x firmware only supports indexes 4, 5, 9, and 10. Changing 4 or 5 will modify the same thermistor calibration value. Changing 9 or 10 will modify the same RTD calibration value.

When calibrating ITE measurement, VTE measurement, or VTE 4-wire measurement, use positive currents/voltages during the calibration process.

You must enable editing of user calibration values with the TEC:USERCAL:EDIT command.

See Also: TEC:USERCAL:EDIT, TEC:USERCAL:GET?

Support: This function is only available in firmware version 1.30 and later. Only limited indexes are available in pre-2.0 firmware (indexes 4, 5, 9, and 10). For version 1.xx firmware, see the controller’s manual for details on how the calibration data is managed.

**TEC:USERCAL:RESET**

**Synopsis**: Resets all TEC user calibration settings to factory defaults

**Syntax**: TEC:USERCAL:RESET

**Details**: Resets all TEC user calibration slopes to 1 and all offsets to 0.

**See Also**: TEC:USERCAL:EDIT

**Support**: This function is only available in firmware version 1.30 and later.
**TEC:V?**

**Synopsis**
Query the actual TEC voltage

**Syntax**
TEC:V?

**Details**
Returns the actual (measured) TEC voltage.

<table>
<thead>
<tr>
<th>Response</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>voltage</td>
<td>Actual TEC voltage, in volts</td>
</tr>
</tbody>
</table>

TEC:T

---

**TEC:VSENSE**

**Synopsis**
Select local or remote voltage sense

**Syntax**
TEC:VSENSE select

**Details**
For instruments that support selectable local/remote voltage sense, this command selects local or remote sense.

<table>
<thead>
<tr>
<th>Argument</th>

</table>

**See Also**
TEC:VSENSE?

**Support**
Only supported on instrument equipped with 4-wire voltage sense capability. See your controller’s manual for more details.

---

**TEC: VSENSE?**

**Synopsis**
Queries the voltage sense selection.

**Syntax**
TEC:VSENSE?

**Details**
For instruments that support selectable local/remote voltage sense, this command returns the select value. See the TEC:VSENSE command for more information.

**See Also**
TEC:VSENSE

**Support**
Only supported on instrument equipped with 4-wire voltage sense capability. See your controller’s manual for more details.

---

**TERM**

**Synopsis**
Set response terminator

**Syntax**
TERM terminator

**Details**
This command controls the termination characters used for responses to queries.
### TERM?

**Synopsis**
Query response terminator

**Syntax**
TERM?

**Details**
Returns the current response terminator setting. See the TERM command for a complete definition of possible return values.

**See Also**
TERM

### TERMINAL

**Synopsis**
Set terminal mode

**Syntax**
TERMINAL enable

**Details**
The command controls the echo of characters back to the PC, typically used when manually controlling the instrument via a terminal software package such as HyperTerminal.

<table>
<thead>
<tr>
<th>Argument</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>0</td>
<td>Echo disabled</td>
</tr>
<tr>
<td></td>

TERMINAL?

### TERMINAL?

**Synopsis**
Query terminal mode

**Syntax**
TERMINAL?

**Details**
Returns the current response terminal mode setting. See the TERMINAL command for a complete definition of possible return values.

**See Also**
TERMINAL

### TIME?

**Synopsis**
Query run time

**Syntax**
TIME?

**Details**
Returns the elapsed time since the unit has been turned on. Format is in HH:MM:SS.ss, where HH is hours, MM is minutes, SS is seconds, and ss is hundredths of a second.

**See Also**
TIMER
### TIMER?

**Synopsis**
Query time since last TIMER?

**Syntax**
TIMER?

**Details**
Returns the elapsed time since the last TIMER? query was received, or, if this is the first TIMER? query, the time since unit has been turned on. Format is in HH:MM:SS.ss, where HH is hours, MM is minutes, SS is seconds, and ss is hundredths of a second.

**See Also**
TIME?

### VER?

**Synopsis**
Query the firmware version

**Syntax**
VER?

**Details**
Returns the firmware version. This is the same information that is part of the *IDN? query.

**See Also**
*IDN?
## Error Messages
